March 25, 2010	<input checked="" type="checkbox"/> Formal Action/Request <input type="checkbox"/> Information Only <input type="checkbox"/> Other	Child Support Guidelines Review Committee – FINAL REPORT & RECOMMENDATIONS

FROM: Hon. Bruce R. Cohen, Chair of the Guidelines Review Committee

DISCUSSION: The Guidelines Review Committee (GRC) has completed their review of the statewide child support guidelines and is prepared to make recommendations to the Council.

Hon. Bruce R. Cohen, Chair of the Guidelines Review Committee (GRC) will present:

- A summary of feedback and comments received during the last phase of the vetting process.
- Discuss how the GRC overcame parenting time adjustment challenges that arose during the course of this unique review and the practical application to the calculator.
- Final products: Reorganized guidelines with step-by-step instructions, addendums to the guidelines, correlation table, corresponding child support calculator, and a manual instructions booklet.
- Judge Cohen will answer any questions from the Council regarding potential impact to the courts, implementation, or training.

The GRC offers the *Final Report and Recommendations of the Child Support Guidelines Review Committee* which details the GRC's work and construction methodology of the Child Outcome Based Support model.

RECOMMENDED COUNCIL ACTION:

The Child Support Guidelines Review Committee respectfully recommends:

1. Arizona replaces the current child support model with the proposed Child Outcome Based Support model, income tables, and calculator.
2. Approve and adopt the reorganized Child Support Guidelines based upon the proposed model.
3. Authorize the GRC to continue to assist the AOC with training and implementation efforts.

EXECUTIVE SUMMARY
Excerpt from the Final Report and Recommendations of
the Child Support Guideline Review Committee

Challenges Arising from Arizona's Child Support Guidelines Model

- There is consensus that the economic data upon which guidelines were designed is fraught with issues.
- The economic data utilized was conceptually based upon the intact family.
- No identified measure of the cost of raising children exists and as such, guidelines have been developed taking into account purported *expenditures* for children.
- The measure of expenditures utilized is filled with assumptions and value judgments that significantly impacted the resulting child support amounts.
- Guideline results do not correlate with the statutory mandates set forth in A.R.S. § 25-320(D).
- Previous reviews identified concerns regarding the perceived inadequacy of child support in cases where there was a great disparity in earnings between the parents. The inadequacy of the support order was exacerbated as parenting time increased toward an equal allocation of parenting time.
- When utilizing the Income Shares model for determining child support, children whose parents earn, in the aggregate, the same income, can nonetheless find themselves in dramatically different financial circumstances, depending upon whether they reside primarily with the higher or lower earning parent.
- There are circumstances wherein low-income obligors are expected to pay unreasonably high support amounts to high-income custodial parents.

Child Outcomes Based Support Model: *Overview*

The proposed Child Outcomes Based Support model reflects a systematic consideration of the impact of parental separation on the parents and their children to achieve outcomes that protect the financial well-being of the child while remaining fair to both parents.

The proposed Guidelines are based on the financial resources and needs of the child and of each parent, the standard of living the child would have enjoyed in a two-parent household, and the allocation of parenting time, as contemplated by A.R.S. § 25-320(D).

Child Outcomes Based Support Model: *Changes from Current Model*

The Child Outcomes Based Support Model (proposed model) results in a lower support amount than the current model in those instances in which the custodial parent is the higher earner, and higher support amounts for instances in which the noncustodial parent earns greater income. The Child Outcomes Based Support and Income Shares models are fairly equivalent when the financial disparity between the parents lessens. Furthermore,

the greater the income disparity between the two parents, the greater is the difference between the support amounts required by the two systems. This pattern of change reflected in the proposed model is responsive to the concerns of previous review committees, public comments, the family law judiciary, and the legal community.

Substantive Changes to the Child Support Guidelines

- The Child Outcome Based Support model focuses on obtaining fair and adequate outcomes for children based upon the statutory factors outlined in A.R.S. § 25-320(D), rather than focusing on marginal expenditures which do not correlate with the post-separation financial resources and needs of the child or the single parent.
- Reorganized the existing Guidelines so that they may be read in conjunction with the actual calculation of child support.
- Added a section for definitions. (Page 2 – Proposed Guidelines.)
- Changed the process for adjusting income due to support of other children of other relationships. (Page 6 – Proposed Guidelines.)
- Eliminated the need for “Table A” and “Table B” for parenting time adjustments. The parenting time adjustment has been designed to take into account both the variable and duplicated costs each parent incurs on account of children, which depend in part on each parent’s share of the parenting time. (Page 8 – Proposed Guidelines.)
- The three stages of a child support calculation were labeled as the Preliminary Support Amount, Guideline Support Amount, and the Final Support Order. Further definition as noted above will simplify manual calculation for users.
- Each parent’s income was increased from \$20,000 monthly combined income to \$20,000 per month per parent income. (Page 12 – Proposed Guidelines.)
- When five or more children are the subject of the support order, the support amount is calculated based upon four children but the court may deviate from the Guideline Support Amount in accordance with Section IV(A). (Page 12 – Proposed Guidelines.)
- Expanded explanations and examples for Adjustments to Support. (Page 14 – Proposed Guidelines.)
- Better explanation of when the custodial parent would be the parent to pay child support. (Page 16 – Proposed Guidelines.)

- Detailed explanation for rounding the Final Support Amount. (Page 17 – Proposed Guidelines.)
- Better explanation and simplification of travel expenses. (Page 20 – Proposed Guidelines.)
- Examples for deviation from the guidelines better explains circumstances which may justify a deviation. (Page 21 – Proposed Guidelines.)
- Explanation and instruction to calculate child support when there are multiple children and varying parenting time schedules. (Page 22 – Proposed Guidelines.)
- Reorganization of modification and termination of support section.
- New section regarding a basis to phase-in an increased child support order. Explains actions to which phasing in may apply, determining phase-in eligibility, determining appropriateness, and implementation of a phase-in support order. (Page 29 – Proposed Guidelines.)
- **Addendum A – User Guide for Determining Support:** A user-friendly, step-by-step instruction guide for manually determining child support.
- **Addendum B – Parent’s Child Support Worksheet:** (Pending development of calculator.)
- **Addendum C – Correlation Table:** A table that correlates the 2005 Guidelines sections with the proposed Guidelines sections for easy comparison.

Recommendations from the Guideline Review Committee

The Child Support Guidelines Review Committee respectfully recommends:

1. Arizona replaces the current child support model with the proposed Child Outcome Based Support model, income tables, and calculator.
2. Approve and adopt the reorganized Child Support Guidelines based upon the proposed model.
3. Authorize the GRC to continue with the training and implementation efforts.

Psychology, ASU, College of Law

Honorable Sally Simmons
Presiding Judge of Juvenile Court (Effective 7/01/09)
Superior Court in Pima County

Ms. Kim Gillespie
Staff Attorney - (Retired 10/2009)
Arizona Attorney General

Honorable Kevin White
Presiding Family Court Judge
Superior Court in Pinal County

ADMINISTRATIVE OFFICE OF THE COURTS STAFF

Kathy Sekardi
Sr. Court Policy Analyst

Lorraine Nevarez
Administrative Assistant
Tama Reily
Administrative Assistant

COMMENTS FROM THE CHAIR

For years, there has been consensus that the economic data upon which guidelines were designed were fraught with issues. The data utilized was conceptually based upon the intact family. This has perhaps passing relevance to the economic circumstances for children of dual household families. Further, there has been no identified measure of the cost of raising children and as such, guidelines have been developed taking into account purported expenditures for children. Aside from the resulting misconception that a guideline child support amount has bearing on the actual cost of raising a child, the measures of expenditures utilized was filled with presumptions and value judgments that significantly impacted the resulting figures.

It was therefore clear to predecessors of this Guidelines Review Committee (GRC) that it was time to re-think how and upon what we base child support. That work was undertaken by the Interim Committee on Child Support Guidelines (Interim Committee) from February 2005 to June 2006, lead by the driving work of Ira Ellman, Professor of Law at the Sandra Day O'Connor College of Law at Arizona State University. Tara Ellman, an economic analyst, was an on-going contributor to the GRC. She was instrumental to the GRC's progress by creating *Childshare*, a program that was pivotal in developing the Child Outcome Based Support Model (COBS). In addition, Dr. Jane Venohr of the Center for Policy Research supplied the GRC with invaluable data, case studies, and recommendations, all of which were used in concert with the work of the Interim Committee. The product developed from those resources focused on the resulting economic circumstances of a child, either post divorce or being raised in a non-intact family. A measure of this nature is far more appropriate for a child's well-being than are any of the other measures utilized to purportedly create an appropriate child support amount. This approach comports with the statutory mandates for child support, including addressing the needs of the child and considering the child's standard of living. The work of Dr. Burt Barnow, from Johns Hopkins University, ensured that the policies and mandates developed through the GRC were then translated into working guidelines.

This 2008-2010 Child Support Guidelines Review Committee (GRC) was comprised of dedicated and selfless professionals. They exhibited an extraordinary capacity to embrace innovative ideas while maintaining their focus on the overall mandate of securing the financial well-being of children. Members of the GRC demonstrated that they were not bound by convention and yet were deliberate in their consideration of change. The level of collaboration was extraordinary but never at the expense of individual ideas. The contributions of Kathy Sekardi, Sr. Court Policy Analyst, and Lorraine Nevarez, Administrative Assistant, ensured that ideas were captured and converted into a final working product. The Honorable Norman Davis, Presiding Judge of Appointee of the Maricopa County Superior Court, contributed valued insights and assisted greatly in developing instruments under which the Guidelines could be implemented. Janet Sell, Assistant Attorney General dedicated countless hours toward identifying and resolving complex issues. It is through the dedication and expertise of

each of these individuals that these Guidelines will allow for a result oriented determination of child support, a concept that is at the core of child support policies.

CHARGE OF THE GUIDELINES COMMITTEE

In February 2008, Chief Justice Ruth V. McGregor established the Child Support Guidelines Review Committee (GRC) and charged it with reviewing the current statewide child support guidelines and making recommendations for changes to the Guidelines as well as for clarification and simplification of the guidelines. The GRC was also charged with investigating and reporting its findings and recommendations on the advantages and disadvantages of implementing a forward-looking method of calculating child support and its potential impact on the courts. The GRC was aided greatly by the input from Dr. Jane Venohr, Center for Policy Research, and Dr. Burt Barnow, Johns Hopkins University. In addition, the Center for Policy Research was contracted to perform a Case File Review, gathering data from a random sample of child support files taken from four Arizona counties. The Center for Policy Research provided the data in an electronic form accessible by other researchers, which allowed Tara Ellman to analyze data from the case file review report. The GRC was able to assess the impact of both the Income Shares and COBS schedules on two post-separation parental households of varying incomes in which the child or children live, and to examine whether those resulting support amounts properly implement the statutory mandates in A.R.S. § 25-320(D).

WORK OF THE GUIDELINES COMMITTEE

The Child Support Guidelines Review Committee (GRC) worked concurrently on updating the current guidelines model (Phase I), while also investigating and examining output results for a forward-looking method based upon a new guideline model called Child Outcome Based Support Model (COBS). (Phase II).

The GRC shared preliminary reports regarding its work with the legislative Child Support Committee, the Arizona Association of the Superior Court Clerks, the Committee on Superior Court (COSC), the COSC Advisory Workgroup, and the Arizona Judicial Council in October 2008. The GRC also facilitated meetings with numerous system stakeholders such as court administrators, judges and commissioners, Arizona State Bar members, members of the Pima County and Maricopa County Family Law Sections of the Bar, Assistant Attorney Generals, and service providers at three Maricopa County Regional courthouses. The GRC also encouraged participation from the public by creating access to the GRC's "Public Comment" webpage. The public was requested to record their comments in order for the GRC members to review and consider prior to deliberating on the updated guidelines. Upon completion of a draft proposal the GRC returned to the groups and stakeholders for comment and input. From that further changes were made to the draft proposal ensuring that the final guidelines reflect the collaboration necessary to develop a fully-vetted final product.

The GRC included members and former members of the judiciary, commissioners experienced with Title IV-D issues, family law attorneys, the State Bar, a prominent family law professor with extensive child support research experience, an assistant attorney general, and members with extensive economic experience and background. The GRC was chaired by the Honorable Bruce R. Cohen, Associate Presiding Family Court Judge for the Superior Court in Maricopa County. After having served on each of the child support guideline review committees since 1995, Judge Cohen brought historical knowledge and long-term perspective as to the strengths and weaknesses regarding the methodology for calculating child support. The GRC met regularly from April 2008 until February 2010 through full-day and teleconference meetings, as well as numerous task group meetings over a period of twenty-two months. Four task groups were created to address specific areas of guideline material.

EXECUTIVE SUMMARY

Challenges Arising from Arizona's Child Support Guidelines Model

- There is consensus that the economic data upon which guidelines were designed is fraught with issues.
- The economic data utilized was conceptually based upon the intact family.
- No identified measure of the cost of raising children exists and as such, guidelines have been developed taking into account purported *expenditures* for children.
- The measure of expenditures utilized is filled with assumptions and value judgments that significantly impacted the resulting child support amounts.
- Guideline results do not correlate with the statutory mandates set forth in A.R.S. § 25-320(D).
- Previous reviews identified concerns regarding the perceived inadequacy of child support in cases where there was a great disparity in earnings between the parents. The inadequacy of the support order was exacerbated as parenting time increased toward an equal allocation of parenting time.
- When utilizing the Income Shares model for determining child support, children whose parents earn, in the aggregate, the same income, can nonetheless find themselves in dramatically different financial circumstances, depending upon whether they reside primarily with the higher or lower earning parent.
- There are circumstances wherein low-income obligors are expected to pay unreasonably high support amounts to high-income custodial parents.

Child Outcomes Based Support Model: *Overview*

The proposed Child Outcomes Based Support model reflects a systematic consideration of the impact of parental separation on the parents and their children to achieve outcomes that protect the financial well-being of the child while remaining fair to both parents.

The proposed Guidelines are based on the financial resources and needs of the child and of each parent, the standard of living the child would have enjoyed in a two-parent household, and the allocation of parenting time, as contemplated by A.R.S. § 25-320(D).

Child Outcomes Based Support Model: *Changes from Current Model*

The Child Outcomes Based Support Model (proposed model) results in a lower support amount than the current model in those instances in which the custodial parent is the higher earner, and higher support amounts for instances in which the noncustodial parent earns greater income. The Child Outcomes Based Support and Income Shares models are fairly equivalent when the financial disparity between the parents lessens. Furthermore,

the greater the income disparity between the two parents, the greater is the difference between the support amounts required by the two systems. This pattern of change reflected in the proposed model is responsive to the concerns of previous review committees, public comments, the family law judiciary, and the legal community.

Substantive Changes to the Child Support Guidelines

- The Child Outcome Based Support model focuses on obtaining fair and adequate outcomes for children based upon the statutory factors outlined in A.R.S. § 25-320(D), rather than focusing on marginal expenditures which do not correlate with the post-separation financial resources and needs of the child or the single parent.
- Reorganized the existing Guidelines so that they may be read in conjunction with the actual calculation of child support.
- Added a section for definitions. (Page 2 – Proposed Guidelines.)
- Changed the process for adjusting income due to support of other children of other relationships. (Page 6 – Proposed Guidelines.)
- Eliminated the need for “Table A” and “Table B” for parenting time adjustments. The parenting time adjustment has been designed to take into account both the variable and duplicated costs each parent incurs on account of children, which depend in part on each parent’s share of the parenting time. (Page 8 – Proposed Guidelines.)
- The three stages of a child support calculation were labeled as the Preliminary Support Amount, Guideline Support Amount, and the Final Support Order. Further definition as noted above will simplify manual calculation for users.
- Each parent’s income was increased from \$20,000 monthly combined income to \$20,000 per month per parent income. (Page 12 – Proposed Guidelines.)
- When five or more children are the subject of the support order, the support amount is calculated based upon four children but the court may deviate from the Guideline Support Amount in accordance with Section IV(A). (Page 12 – Proposed Guidelines.)
- Expanded explanations and examples for Adjustments to Support. (Page 14 – Proposed Guidelines.)
- Better explanation of when the custodial parent would be the parent to pay child support. (Page 16 – Proposed Guidelines.)

- Detailed explanation for rounding the Final Support Amount. (Page 17 – Proposed Guidelines.)
- Better explanation and simplification of travel expenses. (Page 20 – Proposed Guidelines.)
- Examples for deviation from the guidelines better explains circumstances which may justify a deviation. (Page 21 – Proposed Guidelines.)
- Explanation and instruction to calculate child support when there are multiple children and varying parenting time schedules. (Page 22 – Proposed Guidelines.)
- Reorganization of modification and termination of support section.
- New section regarding a basis to phase-in an increased child support order. Explains actions to which phasing in may apply, determining phase-in eligibility, determining appropriateness, and implementation of a phase-in support order. (Page 29 – Proposed Guidelines.)
- **Addendum A – User Guide for Determining Support** - A user-friendly, step-by-step instruction guide for manually determining child support.
- **Addendum B – Parent’s Child Support** Worksheet - (Pending development of calculator.)
- **Addendum C – Correlation Table** - A table that correlates the 2005 Guidelines sections with the proposed Guidelines sections for easy comparison. (Page 36 – Proposed Guidelines.)

Recommendations from the Guideline Review Committee

The Child Support Guidelines Review Committee respectfully recommends:

1. Arizona replaces the current child support model with the proposed Child Outcome Based Support model, income tables, and calculator.
2. Approve and adopt the reorganized Child Support Guidelines based upon the proposed model.
3. Authorize the GRC to continue with the training and implementation efforts.

INTRODUCTION

I. GENERAL BACKGROUND

Federal law has required state advisory child support guidelines since 1987.¹ The Family Support Act of 1988 (FSA) expanded the requirement to require presumptive guidelines rather than advisory guidelines. The new law required all child support orders entered by a court or state agency to be based on the state's guidelines and to establish deviation criteria that allow for the rebuttal of the state's presumptive guidelines. The state-determined criteria must take into consideration the best interests of the child.

Federal regulation requires states to review their child support guidelines at least once every four years.² The federal requirement specifies that the review must include an assessment of economic data on child-rearing costs and a review of case data to ensure that deviations from guidelines are limited. The purpose of the federal review is to ensure that state guidelines result in the determination of appropriate child support award amounts.

Pursuant to A.R.S. § 25-320(D), the Supreme Court shall establish guidelines for determining the amount of child support and review the guidelines at least once every four years to ensure that their application results in the determination of appropriate child support amounts. Review of the existing guidelines, including an analysis of current economic data and a review of data from court case files, was undertaken by the Administrative Office of the Courts in 2008. Arizona last reviewed their guidelines in 2004. The Administrative Office of the Courts contracts with a consultant to update the schedules and collect data to analyze the case file review.

Arizona's child support orders are set using the child support guidelines³ (Arizona Supreme Court Administrative Order No. 2004 – 29.)⁴ Arizona has used the Income Shares model. The defining feature of an Income Shares model is that it sets the basic support obligation as a percentage of the combined parental income, and requires the

1 Advisory statewide guidelines were required as part of Child Support Enforcement Amendments of 1984 [P.L. No. 98-378]. The federal government hoped to accomplish four main goals, each goal corresponding to the perceived problems of the common law method of determining child support by (1) increasing the adequacy of child support awards; (2) increasing the consistency and predictability of child support awards; (3) increasing compliance through perceived fairness of child support awards; and (4) increasing the ease of administration of child support cases.

2 [45 CFR §302.56] Requires states to have support guidelines that a) are applicable statewide; b) take into consideration the noncustodial parent's earnings and income; c) are based on specific numeric and descriptive criteria; and d) result in a computation of the support obligation; and e) are reviewed and if necessary, revised, at least once every four years.

3 Current Child Support Guidelines in effect January 1, 2005 located at: <http://supreme.state.az.us/csgrc/Documents/2005-CSG.pdf>

4 Arizona Supreme Court Administrative Order No. 2004-29 located at: <http://www.supreme.state.az.us/orders/admorder/Orders04/2004-29.pdf>

support obligor to pay a share of this basic support obligation proportional to his or her share of the combined parental income.

There is a further adjustment to reflect the parent's relative share of parenting time. The initial calculation effectively assumes that a parent with greater parenting time has the child all of the time and that the other parent's time is so limited that there is no occasion to make any direct expenditures on the child's behalf. The parenting time adjustment is meant to correct this assumption for the great majority of cases in which it is not accurate. It recognizes that the "noncustodial" parent is in fact typically the custodian for a portion of the time and therefore, like the "custodial parent," fulfills at least a portion of the support obligation through the expenses incurred directly in caring for the children. The adjustment therefore reduces the cash payments made to the primary custodian to reflect the expenditures made directly for the benefit of the child. In general, the parenting adjustment is designed to vary with the number of "parenting days" the child is with the "noncustodial" parent. The original design of the parenting adjustment raises complications, which, as explained below, are addressed and refined by this Guidelines Committee.

There are 38 states that use some form of the Income Shares model.⁵ The support amounts specified in most income shares guidelines, including Arizona's, are based on estimates of the marginal expenditures on children in intact families. They are also referred to as Marginal Expenditure Guidelines (MEG). There are several competing methods for estimating marginal expenditures, and, as the *Basis of an Updated Child Support Schedule for Arizona* (MEG report) explains, they yield different results. The general consensus among economists is that each method has deficiencies. Arizona's guidelines are based on marginal expenditure estimates formulated by Dr. Betson, using the Rothbarth method. It assumes that two families of different composition and different incomes have the same standard of living if they spend the same amount of money on alcohol, cigarettes, and adult clothing. The principal alternative historically used for generating support guidelines is Engel, which depends upon the alternative assumption that families of different composition and income have the same living standard if they spend the same proportion of their income on food consumed at home. Implementing either method requires estimates of what households at various income levels spend on adult clothing, alcohol, and cigarettes, or on groceries, and therefore either method necessarily relies on the Consumer Expenditure Survey (CES), the only source of such data. The CES asks consumers to tell interviewers what they earned in the past quarter, and what they remember spending in the past quarter on each of hundreds of categories of items meant to capture every possible expenditure a family may make. Systematic errors in the consumer self-reports pose a considerable challenge to this use of CES data, a use for which it was not designed.

As the MEG report indicates, the Rothbarth method, which the Arizona MEG guidelines are based, consistently yields lower estimates of marginal expenditures on children than does the Engel method. About 26 MEG states currently use the Rothbarth method, which Betson favors, while seven use older estimates based on Engel, and one uses a

⁵ Counts vary depending on how an income shares system is defined.

combination of the two. Higher expenditure estimates flow from a method developed by Mark Lino at the Department of Agriculture, because these estimates are based on a blend of marginal and per capital expenditures. Minnesota uses the Agriculture Department estimates for its guidelines, and it appears Kansas uses a similar approach. While all MEG states share an overall structure in their support guidelines, the support amounts they require vary considerably from state to state, in part because of these different expenditure estimates. The report suggests that many of the 26 states using the Rothbarth estimates of marginal expenditures superimpose various adjustments on them that yield differences in their support guidelines.

Most of the remaining states use the Percentage of Obligor Income (POOI) system, which differs from income shares because it sets support amounts by applying a percentage to the obligor's income, without considering the income of the custodial parent.⁶ The percentages adopted by POOI guidelines are also based on estimates of the marginal expenditures on children. A POOI guideline and an income shares guideline that employed the same estimate of marginal expenditures would, as a matter of basic arithmetic, require the same amount of Support for any given parental income. For example, suppose there was agreement that when there are two children, the marginal expenditures on children in an intact family equaled 20% of the parental gross income. Consider the case in which the custodial mother earns \$2,000 a month in gross income, and the noncustodial father earns \$4,000. The income shares guideline would calculate the basic support amount by applying the 20% estimate to the total parental income of \$6,000, and then allocating the resulting figure of \$1,200 (.2 times \$6,000) between the parents in proportion to their incomes. Because the father in this example earns two-thirds of the parental example (\$4,000 out of \$6,000), his basic support amount equals two-thirds of \$1,200, or \$800. A POOI guideline would reach the same result but more directly, by applying the 20% marginal expenditure estimate directly to the father's income of \$4,000, which also yields \$800.

Why then does any state employ income shares, if POOI guidelines reach the same result through a simpler calculation? It turns out the real difference between POOI and income shares guidelines are the estimates on marginal expenditures on which they rely. As the MEG report explains, POOI states typically rely on older estimates by Van de Gaag that yields flat rates. Income Shares states like Arizona, by contrast, generally rely on marginal expenditure estimates that decline rapidly with income, resulting in regressive schedules, in which the support percentage declines as parental income increases. The difference is illustrated in **Figure 1**, which shows the one-child support percentages, at different parental incomes levels, for both the current Arizona guideline and the current Wisconsin guideline (Wisconsin is the originator of POOI guidelines and continues to adhere to them.) To take one illustrative pair of cases, revealed by **Figure 1**, when both parents earn \$1,000 the obligor's basic support obligation under Arizona's Income Shares approach is a rate of 21% of parental gross income, but if one parent earns \$1,000 and the

6 A few states blend income shares and POOI (such as New York), use an alternative known as the Melson formula (Delaware) or use a method that is superficially similar to income shares but departs in important ways in generating the support numbers for the Basic Obligation Table (Massachusetts).

other \$7,000, the rate becomes 12%. Under Wisconsin's POOI approach the rate remains 17% regardless of whether the recipient parent earns \$1,000 or \$7,000 per month.

Figure 1⁷

Arizona's regressive rates structure has consequences that have given prior guidelines review committees some concern. But the POOI system is also problematic because it sets support amounts without considering the income of the custodial parent. A scientific study of the views of Arizona

citizens (the Tucson jury pool study⁸) showed that men and women alike consistently favor support schedules that consider *both* parent's incomes, and believe support obligors, at any given income, should pay support amounts that increase as the income of the custodial parent declines. But at the same time, it seems Arizona citizens also reject a regressive rate structure: at least within the income range they were asked about (\$2,000 to \$6,000 in net income for the support obligor). They do *not* believe that higher income obligors should pay a lower percentage of their income in support than do lower income obligors. It appears that neither the current Income Shares system, nor the common POOI alternative, has a rate structure that reflects the views of Arizona citizens.

The GRC has been mindful of § 25-320(D) of the A.R.S., which provides, in pertinent part:

“The supreme court shall base the guidelines and criteria for deviation from them on all relevant factors, including:

1. The financial resources and needs of the child.

⁷ This graph covers incomes up to \$14,000 monthly gross income, which includes about 96% of all families who come before Arizona courts in child support matters.

⁸ The first published account of this study can be found in the peer-reviewed Journal of Empirical Legal Studies published by Cornell University. Ellman, Braver, and MacCoun, *Intuitive Lawmaking: The Example of Child Support*, 6 Journal of Empirical Legal Studies 69 (2009). Respondents were Arizona citizens called for jury service in Pima County, who completed comprehensive survey forms developed after months of careful methodological testing. The forms were administered while the respondents waited to be called for service in the Jury Assembly room. Survey respondents were asked about the amount of child support they believed appropriate in a large group of cases, about principles they believed should be the basis of support awards, as well as about other issues relevant to child support policy. While the responses of men and women were significantly different on many questions, they were not importantly different on any of the items described in this report.

2. The financial resources and needs of the custodial parent.
3. The standard of living the child would have enjoyed had the marriage not been dissolved.
4. The physical and emotional condition of the child, and the child's educational needs.
5. The financial resources and needs of the noncustodial parent.
6. The medical support plan for the child. The plan should include the child's medical support needs, the availability of medical insurance or services provided by the Arizona health care cost containment system and whether a cash medical support order is necessary.
7. Excessive or abnormal expenditures, destruction, concealment or fraudulent disposition of community, joint tenancy and other property held in common.
8. The duration of parenting time and related expenses.”

Both POOI and Income Shares systems can, and the current system does, provide for a parenting adjustment (factor 8), for medical support as a required adjustment to the basic guideline amount (factor 6) and for deviations as required to take account of factors 4 and 7 (which must be dealt with as deviations because neither factor can be treated appropriately within the confines of a table of support amounts that apply to all families of a given size and income). The question for the committee was whether the current guideline or any proposed guideline gives sufficient consideration to the remaining factors, 1, 2, 3, and 5. A POOI system would not be an improvement in this regard, because it bases its calculation entirely on the financial resources of the noncustodial parent, which is just one part of factor 5. An income shares guideline is better because it also considers the custodial parent's income, a part of factor 2. The question for the committee, however, was whether an income shares guideline based on marginal expenditures on children in intact families gives adequate consideration to the needs of either parent (a part of factors 1 and 5), and, most importantly, to the financial needs of the child (factor 1), or the standard of living the child would have enjoyed had the marriage not been dissolved (factor 3). The committee's focus, was on whether a different approach to guideline construction would yield support calculations that took better account of all the factors specified in A.R.S. § 25-320(D).

II. HISTORY: WHAT BROUGHT ABOUT RECONSIDERATION OF HOW CHILD SUPPORT IS CALCULATED

While a regressive rates structure (child support declines as a percentage of parental income as income goes up) is typical of Income Shares states, Arizona's current guidelines, adopted in 2005, exaggerated that pattern as compared to the prior version. The support amounts previously required of higher income obligors were reduced and the support amounts previously required for lower income obligors were increased. Further concerns were identified regarding the perceived inadequacy of child support in cases in which there was a great disparity in earnings between the parents. This became

exacerbated as parenting time increased toward an equal allocation. There also remained ongoing questions as to the propriety of using marginal expenditures of intact families in calculating child support.

While the 2004 Guidelines Review Committee recognized these issues, it was not practical for the 2004 Committee itself to revise the proposed schedule of basic support obligations, or to examine the methods used to create it, especially within the time constraints imposed by the regular quadrennial review process. The 2004 Guidelines Committee therefore settled on a compromise: while recommending adoption of the proposed schedule, it also urged the creation of an Interim Committee to consider whether Arizona should employ a different method for constructing its support guidelines for the next quadrennial review. Both recommendations were incorporated into the charge of the current Committee. The Interim Committee was created in 2006 under the legislative Child Support Committee to consider alternative methods for constructing child support guidelines that would be more faithful to the statutory mandate.

The Interim Committee's final report⁹ recommended replacing the traditional Income Shares method for generating Arizona's support guidelines with a new system. The Interim Committee found that the traditional method based the schedule of basic support obligations on estimates of the additional ("marginal") expenditures of an intact family would have to make to maintain its living standard if children were added to it. The Interim Committee believed that basing support amounts on estimates of marginal expenditures in intact families had serious policy implications that had never been examined against the mandates of A.R.S. § 25-320. As the Interim Committee observed in its final report, the existing Incomes Shares method "yields results in certain categories of cases that are problematic." As explained by the Interim Committee:

1. The child's financial well-being depends primarily upon the income of the custodial parent, and relatively little on the income of the support obligor. If the custodial parent is poor, the custodial household remains poor even when the income in the noncustodial household is higher. This feature of Income Shares guidelines is the direct result of basing support amounts on marginal child expenditures in intact families.
2. Children whose parents earn in the aggregate the same income can nonetheless find themselves in dramatically different financial circumstances depending upon whether they live primarily with the higher or lower earning parent. This financial disparity between the two parents' households becomes even more pronounced as the allocation of custodial responsibility between them approaches equality.
3. Low-income obligors are expected to pay unreasonably high support amounts to high-income custodial parents, given that in these cases the child enjoys a much higher living standard than the obligor even before any support is paid.

⁹ The final report was issued in 2007.

As the Interim Committee concluded, these problematic results are largely the result of basing a support schedule *exclusively* on estimates of *marginal* expenditures in *intact* families. First, such a method does not consider the financial impact of parental separation on either the child or the parents. Second, it gives no consideration to *other* expenditures intact families make that confer benefits on their children. For example, a marginal analysis counts only the *additional* rent parents pay, when they add a child, for an apartment with one more bedroom, but does not count any of the base rent that buys the kitchen, the bathroom, and the living room. A support amount based on marginal expenditure estimates (a marginal expenditure guideline, or MEG) is designed to require the obligor to pay his or her share of the extra bedroom's costs, but nothing for these other costs. Support amounts based on marginal estimates produce plausible results when the parents are equal earners because the parents are equally capable of providing the base to which the marginal expenditures are added. But when the custodial parent earns less than the noncustodial parent, the child support payments tend to be inadequate.

Perhaps more importantly for our purposes, this exclusive focus on marginal expenditures effectively ignores most of the factors that A.R.S. § 25-320(D) directs the Supreme Court to consider in fashioning support guidelines. The marginal expenditures on children made by married parents do not correlate with the post-separation financial resources and needs of the child or the single parent. It does not measure the child's living standard during the marriage, because the child's marital living standard depends on *all* the parental expenditures during the marriage, not just the marginal expenditures. The Child Outcome Based Support (COBS) method explained below confirms what the Interim Committee could intuit, that the traditional system produces support schedules that yield problematic results for the cases in which parental incomes are disparate. As outlined below, the problem is symmetrical. When the noncustodial parent earns much more than the primary custodian, the result can be a support schedule that leaves a previously middle class child living in the custodial household struggling with or below a minimally adequate income, while the noncustodial parent enjoys a living standard that is much higher than during the marriage.

Perhaps less obviously, but also revealed by the COBS analysis, the exclusive focus on marginal expenditures also gives no consideration to the financial resources and needs of the lower-income noncustodial parent. This situation becomes problematic when the custodial parent's income is significantly higher.

For reasons such as these, the Interim Committee recommended exploring a shift from the current system in the next quadrennial review. Rather than basing child support amounts on backward-looking estimates of marginal expenditures in the intact family that no longer exists, or which never existed, a new system was developed in which support amounts are based on a forward-looking examination of the two parental households in which the child will reside. The approach (later named Child Outcome Based Support or COBS) is far more consistent with the statutory mandates.

THE CHILD OUTCOME BASED SUPPORT MODEL – COBS

I. Organization of this phase.

The Administrative Office of the Courts contracted with Johns Hopkins University, Institute for Policy Studies, to assist the GRC with development and analysis of the alternative model, which the GRC has named Child Outcome Based Support (COBS).¹⁰ A task group was formed (Spreadsheet Study Task Group), to work with the consultant to develop this alternative method for child support calculation.

II. Method Employed to Create the COBS Schedule.

Both the substance and the procedure used for implementing COBS followed the recommendations contained in Section VI of the Report of the Interim Committee on Child Support Guidelines. The method employs six basic steps:

1. Deciding on the outcome measures or benchmarks to use in evaluating the effect on both parents and the child of any particular support amount.
2. Examining the current guidelines numbers against these benchmarks, as well as the updated numbers set forth in the *Basis of an Updated Child Support Schedule for Arizona* and the numbers contained in the guidelines of other states.
3. Generating proposed new numbers.
4. Generating a method for incorporating a parenting adjustment into the new numbers.
5. Looking back to examine the patterns of the numbers to prevent anomalies.
6. Comparing the final set of numbers with support amounts calculated under support methods utilized in other states.

A. Step 1 - Choosing and Employing Outcome Benchmarks

The task group assessed outcomes against the four factors that A.R.S. § 25-320 requires the guideline schedule to consider. They are:

1. The financial resources and needs of the child.
2. The financial resources and needs of the custodial parent.
3. The financial resources and needs of the noncustodial parent.
4. The standard of living the child would have enjoyed had the marriage not been dissolved.

¹⁰ Johns Hopkins University Proposal to the Arizona Supreme Court, RFP 07-05.

Outcome benchmarks were developed for each of the first four factors. The fifth factor was taken into account because the benchmark calculations included appropriate adjustments to reflect the parenting time allocation. What is required to balance the statutory factors is a common metric so that the living standard of each parent and the children can be compared with one another and with the intact family living standard. One cannot simply compare the incomes of the parties, because the intact household of two parents and their children requires a different income to maintain at any given living standard than does a household of a single parent with the children, and different again from a single adult living without children. When parenting time is taken into account, as A.R.S. § 25-320(D) also requires, the comparison becomes more complex.

The task group identified two living standard measures to serve as these common metrics, a measure of a middle class living standard based on Arizona data, and a measure of minimally adequate income to meet a family's basic needs, also informed by Arizona data. Each measure could be adjusted as needed to reflect the household composition and the parenting time arrangements. They are each described below.

- a. ***Middle Class Living Standard Income*** is based on the median household income in Arizona for families of four, identified as \$69,210.¹¹ (Half of all Arizona families of four have incomes below this amount, and half above.) The task group took this figure as the income required for an intact Arizona family of four to enjoy an “average” middle class living standard. Having established that, the consultant employed an equivalence formula recommended by the National Academy of Sciences¹² to determine the income that households of other compositions (such as a single person, or a single mother and two children) would require in order to have an equivalent middle class living standard.
- b. ***Minimally Adequate Income*** is the income required to buy basic necessities with nothing left over for any extras. The minimally adequate income is not the same as the poverty threshold.¹³ For these purposes, “minimally adequate

11 This estimate is based on the American Community Survey, administered by the Census Bureau, for 2007, the most recent available at this time. The margin of error of this estimate is \$2,614, at a 90% confidence interval. The spreadsheet prepared by the Census Bureau that provides median family income by state and household size can be found at

<http://www.census.gov/hhes/www/income/statemedfaminc.html>.

12 The NAS formula assumes that there are economies of scale when an additional person (adult or child) is added to any household, and that the marginal cost of a child is .7 of the cost of an adult. Using this NAS equivalence formula, Professor Barnow constructed a table showing the income that couples and single persons, with children, would require to have a living standard equivalent to the standard of a couple with two children with an income of \$69,210. The table covers couples with anywhere from one to six children, single persons with anywhere from one to six children, and single persons living alone.

13 The current poverty threshold for a single person is a monthly income of \$903. For a basic understanding of the poverty threshold, prepared by the Census Bureau, see <http://www.census.gov/hhes/www/poverty/povdef.html>. For a broad overview of the history and issues

income” was 170% of the federal poverty threshold, which falls within the range of percentages utilized in many means-tested programs.¹⁴ This estimate of the minimally adequate income was also consistent with the results of the Tucson jury pool study.¹⁵

Tara Ellman created a spreadsheet program named *Childshare* that allowed the task group to examine a set of outcome measures employing these benchmarks for any proposed set of child support payments. **Figures 2 and 3** provide full-page examples of the output of *Childshare*, as used by the GRC. These examples provide outcome measures for the child support amounts in a set of cases in which each parent’s gross income is either \$1,000, \$2,000, \$4,000, \$6,000, or \$10,000. It produces a grid with 36 cells analyzing outcomes for the 36 possible combinations of parental incomes (6 incomes for the custodial parent, times 6 for the support obligor). **Figure 2** (below) presents this outcome analysis for the support amounts called for under the proposed update of our current marginal expenditure guideline (MEG) while **Figure 3** (below) presents the same analysis for the support amounts that result from application of the new COBS system. (In both cases, these are the support amounts based on parental incomes, number of children, and the parenting time arrangement; further adjustments to reflect child care expenses, medical support orders, etc., are made in both systems on a case by case basis).

One can see, looking at either Figure 2 or 3 that each cell is the intersection of the two parental *gross* incomes because Arizona has traditionally adopted guidelines based on the parents’ gross income. Note, however, that below each gross income on the outcome grid is an after-tax income, and the outcome measures are based on this after-tax income. (Because of the Earned Income Tax Credit (EITC) custodial parents with a gross income of \$1,000 have an average after-tax income that is higher--\$1,187.) *Childshare*’s method for calculating the after-tax

with the poverty threshold, see the HHS account at <http://aspe.hhs.gov/poverty/contacts.shtml>. For a description of efforts to update the measure, undertaken by a panel of the National Academy of Sciences at the direction of the Census Bureau, see <http://www.cbpp.org/cms/index.cfm?fa=view&id=1385>. For a summary of the recommendations of that panel prepared by the Rapporteur, see http://www.nap.edu/catalog.php?record_id=11166.

14 For example, a household is eligible for food stamps so long as the gross income of household members does not exceed 130% of the poverty threshold, while the maximum income allowed to be eligible for WIC (The Special Supplemental Nutrition Program for Women, Infants and Children) is 185% of the poverty threshold.

15 The following question was among those answered by more than 400 members of the Tucson jury pool: Imagine that a young single woman with a 9 year-old child wished to move to Tucson, and asked you how much money she would need to spend each month just to keep herself out of poverty (in other words, have enough to eat, a safe place to live, clean clothing, transportation, and health care, but no extras.) What would you tell her is your best guess of how much money she would need to spend per month for this?" The first published account of this large study, which includes the results reported here, can be found in the peer-reviewed *Journal of Empirical Legal Studies* published by Cornell University. Ellman, Braver, and MacCoun, *Intuitive Lawmaking: The Example of Child Support*, 6 *Journal of Empirical Legal Studies* 69 (2009).

equivalents of a gross income are somewhat different than the method used in constructing the current MEG guidelines.¹⁶

Figure 2 – Updated Income Shares Model (MEG Model)

Assumes 1 child, 100 parenting days, Self-Support Reserve of \$903

Figure 3 – Child Outcome Based Support Model (COBS Model)

Assumes 1 child, 100 parenting days, Self-Support Reserve of \$903

16 The calculations that underlie the Table of Basic Support obligations in both the current MEG guidelines and their proposed update are based on net incomes, even though users are instructed to look up the Basic Support Obligation in the Table on the basis of the parents' total gross income. The support amounts in the table for any particular gross income is the amount that has been calculated for the equivalent net income. See *Basis of an updated Child Support Schedule for Arizona*, pages 40-41. To calculate the net income equivalent to the gross incomes in the table the MEG guidelines it is assumed that all parental income is earned income, and that both parents are taxed at the withholding table rate applicable to a single person. *Id.* This set of assumptions yields higher tax rates and lower support amounts than the plausible alternative assumptions that might have been used (e.g., that the custodial parent is taxed at the head of household rate, that one of the parents at least has remarried, or that some of the income is taxed at the most favorable rates that apply to capital gain income).

Childshare uses a different method. It calculates the equivalent after-tax income for any given gross income by first assuming that the noncustodial parent is taxed as a single person and the custodial parent is taxed as head of household with exemptions equal to the parent plus the number of children. (For this purpose the tax information provided by the Internal Revenue Service (IRS) groups together all households with 3 or more children; there is no separate information for households of four, five or six children.) The average federal income tax actually paid by single persons and by heads of households across a set of gross incomes was obtained from the IRS. To this federal tax liability, an additional 20 percent was added, as an estimate of the state income tax for any particular income. (For the purpose of this calculation, it is assumed that anyone who receives an Earned Income Tax Credit (EITC) payment from the federal government has a zero state income tax liability.) Finally, an estimate of FICA and Medicare tax paid was added by applying the applicable rates to the income (assuming that all the income was earned income that is subject to these levies).

Of course, any assumption utilized will not be applicable in all cases.

MEG -- 1 CHILD -- 100 DAYS PARENTING TIME -- printed 9-25-09

Benchmarks are adjusted for number of days of parenting time. Parenting time reduces expenses of the CP hh (raising SOL compared to unadjusted benchmarks) and increases exp of NCP hh (decreasing SOL).

COBS -- 1 CHILD -- 100 DAYS PARENTING TIME -- printed 9-25-09

Benchmarks are adjusted for number of days of parenting time. Parenting time reduces expenses of the CP hh (raising SOL compared to unadjusted benchmarks) and increases exp of NCP hh (decreasing SOL).

Assumptions for this case

Calculation method for this scenario:

Method C - COBS

Number of children

1

Middle Income Standard of Living (SOL) Benchmarks:

2007 AZ Middle Income Benchmarks AFTER TAXES (Smoothed)

Minimally Adequate Income SOL Benchmark:

Pima county Jury Pool - spending to be "just out of poverty"

Self support reserve for NCP applied?

Yes Self support \$ if applicable: \$ 903

Parenting time adjustment?

"normal" parenting adj for COBS

Parenting days

100.0 (Note: Unless days = 0, benchmarks are adjusted for Parenting Days)

See complete assumptions below chart

The outcome measures calculated by *Childshare* for each cell require some explanation. Many entries are stated as a percentage, because the outcome measure is the income of the parent as a percentage of the benchmark income in question. These benchmark percentages are based, in most cases, on after-tax incomes, as explained below. Going down the contents of any cell, from top to bottom, the entries are as follows:

a. “% middle income SOL - If single, childless” This entry compares the income of each parent to the income a single, childless individual would need to enjoy the middle income living standard.¹⁷ An entry of 100% means that after taking account of taxes and household composition, that parent has the income required to live as well as the median Arizona family of four. A parent at 50% has half the required income; a parent at 200% has twice the required income. This outcome measure is directly tied with the statutory factors. It allows one to compare the living standard the primary custodian would have if single and childless to the living standard that parent has as the primary custodian receiving a support payment and living with the child or children.

b. “As intact family w children” This measure compares the living standard the parents and children had, or would have had, as an intact family (all living together with their combined parental income), to the middle income benchmark. (For the case of children who never lived in an intact family with both parents, it shows the living standard they would have had if their parents had lived together.) One hundred percent means that the intact family had, or would have had, the income required to live as well as the median Arizona family of four. **This measure provides a benchmark with which to assess statutory factor 4, the living standard the child would have had if the marriage had not been dissolved.** That intact family living standard can then be compared to the living standard of each parental household after the separation, both before the child support transfer (benchmark c) and after (benchmarks f and h). At this point, the financial impact of the separation on the child and on each parent, as well as the effect the child support payment has on the post-separation living standard of each household becomes apparent.

c. Separated before payment” This entry shows the income of the custodial parent, before child support is added, as a percentage of the middle income benchmark for a single person who has the children living

¹⁷ As noted, taxes are taken into account for all other middle income benchmarks (b, c, f, g, and h, below). The original middle income benchmark, a gross income measure, is converted to net income. The parental gross income is also converted. The percentage given is the after tax parental income as a percentage of the after tax income equivalent to the benchmark amount. The conversion from gross to net follows the method described above.

with him or her full time. **For most cases it provides a measure of two statutory factors, 1 and 2--the resources and needs of the child and of the custodial parent.**

d. “Support Payment” The COBS or MEG support payment for which the post payment outcomes are calculated.

e. “Income After Pmt.” The support payment is deducted from the noncustodial parent’s income and added to the custodial parent’s income.

f. “% mid-income SOL after pmt, bnchmk adj.” Each parent’s income, after taking account of the child support payment, is compared to the income that parent needs to live as well as the median Arizona family of four. For the purpose of this comparison this middle class benchmark income is adjusted to reflect the allocation of parenting time. That is, the benchmark states the income needed, e.g., by a noncustodial parent who has the children 100 days a year, or a custodial parent who has the children 265 days a year.¹⁸ One may compare this figure with the intact family figure (benchmark *b*), to gauge the impact of the separation on each of the households, and thus to see how the income and resources of each household, after any proposed support payment, compare to one another and to the intact household.

g. “Ratio of SOLs (adj CP divided by adj NCP)” The custodial parent’s percentage of the middle class income benchmark, as calculated in *f*, divided by the noncustodial parent’s percentage as calculated in *f*. If this number is 1, then the two post-separation households have approximately the same living standard after the child support payment is taken into account. If the number is more than 1, then the custodial parent household has a higher living standard; if it is less than one, then the noncustodial household has a higher living standard after accounting for the payment of child support. This assists in seeing how any particular support payment balancing the needs and resources of the noncustodial parent against the needs and resources of the child and the custodial parent. While this

¹⁸ The calculation assumes neither parent is married, and the initial benchmark figures compare the noncustodial parent’s income to the income a single person would require for that benchmark, and the custodial parent to the income a single parent with the appropriate number of children would require. A parenting time adjustment to the benchmark figures are then made to reflect whatever parenting time is assumed for the calculation. That adjustment is made by first identifying the marginal cost of the children’s presence in the household by subtracting the benchmark figure for a single person from the figure for the same benchmark for a household with the custodial parent’s composition. One-half of this dollar marginal cost figure is assumed to be variable costs that rise and fall proportionately with the children’s presence in the household, and the benchmark figure for the custodial parent is therefore reduced by the proportion of these variable costs equal to the proportion of parenting days that the children are with the noncustodial parent. The other half of these marginal costs are assumed to be duplicated costs—expenses that the noncustodial parent incurs by virtue of the children’s visitation, but which do not reduce the expenses of the custodial household. Duplicated costs as well as variable costs are therefore added to the benchmark figure for the noncustodial parent, again in proportion to parenting days.

statistic is useful, one must keep in mind that as the parental incomes in question get further from the middle income benchmark, the less meaningful are these numbers.

h. “% min. adequate inc - after pmt, adj for parenting” This is the same calculation as benchmark *f*, including adjustments for parenting time, except that the parental incomes are compared to the *minimally adequate income* benchmark rather than to the middle class income benchmark. This benchmark is a very helpful supplement to the middle class income benchmark for cases in which one or both parents are low income. . It has less meaning for higher income households.

i. “NCP’s Payment Rate” This is the support payment as a percentage of the noncustodial parent’s after-tax income. **This benchmark helps to ensure that statutory factor 3, above, is given appropriate consideration.**

B. Step 2 - Examining Existing Guideline Numbers Against These Benchmarks

The Guidelines Committee initially used *Childshare* to examine the existing guidelines, but once the existing guidelines were updated, it made more sense to focus on that schedule. As previously explained, **Figure 2** is a *Childshare* analysis of the updated MEG schedule, including the existing method for setting a parenting time adjustment, for one set of cases: one child, 100 days parenting time for the noncustodial parent, and six possible incomes for each of the parents.¹⁹

The *Childshare* analysis of the updated MEG schedule reveals the same basic pattern that concerned the 2004 Guidelines Committee and the Interim Committee: reasonable results when the parents are equal earners, but increasingly problematic results as the earnings of the two parents become more disparate. These conclusions are supported by the following findings.

1. The Equal Earner Diagonal. The shaded cells that form a diagonal line from Cell 1 to Cell 36 (**Figure 2**) are called the *equal earner diagonal* because they present the cases in which the two parents earn the same income as one another. This is the place to start in evaluating or generating any set of child support guidelines because it generally presents the easiest case in which to balance the key statutory factors: the financial resources and needs of the child and each of the parents, and the living standard that the child enjoyed when the family was intact. Parents who are equal

¹⁹ Approximately one-half the support cases involve one child. Further, 100 parenting days is in the most common range seen in the cases, and the income range displayed here, from \$1,000 to \$10,000 for each parent, covers well over 90% of the incomes seen in Arizona child support cases.

earners are entitled to equal living standards in their post-separation households; the allocation of custody should not itself put the household of one parent at a financial advantage to the household of the other parent. Equal outcomes for the two parental households also mean that the child has the same post-separation living standard as both parents. While the resulting living standard is typically less than during the intact marriage, because it costs more to maintain two households than one, the shortfall is shared equally among all parties. The *Childshare* grid (**Figure 2**) shows that the updated MEG schedule comes close to this result for the four cases in which the parents each earn \$4000, \$6000, \$8000, and \$10,000. Outcome measure *g*, the standard of living ratio, is close to 1 in all four of these cases. One can also see that while the two post-separation households in these four cases have a lower living standard than did the intact household, as one would expect, (compare outcome measure *b* to outcome measure *f*) the decline is not precipitous, and both households still exceed the middle income benchmark in all four cases (as indicated by the fact that outcome measure *f* exceeds 100%).

For the two lowest income cases on the equal earner diagonal, \$1,000 and \$2,000, the updated MEG schedule favors the custodial household with a payment that leaves it better off than the support obligor's household. While the needs of the child in a low income custodial household might seem to require this result, at these income levels the noncustodial parent also has a difficult time providing for his or her own basic needs.²⁰ These two cases present a difficult choice. On one hand one might believe the child's needs should be given more weight. On the other hand, Arizona, like most states, has long followed a policy protecting the very lowest income obligors from support demands that would drive them into poverty—or would take money from noncustodial parents already in poverty. The existing system relies entirely on a self support reserve based on the federal poverty threshold to protect low-income noncustodial parents, and its application to Cell 1 (**Figure 2**) in fact reduced the support order to \$97 from \$142. But the \$97 support amount that the updated MEG schedule requires in Cell 1 leaves the noncustodial parent with less than half the “minimally adequate” income (outcome measure *h*), arguably, too much. Because the COBS system also considers the minimally adequate income as a benchmark, it requires a bit less of the noncustodial parent—\$50—which leaves the noncustodial parent with half the minimally adequate income. (See **Figure 3**, the same grid for the COBS support amounts.) Under COBS, the custodial household is still favored, but by less. There is a similar result in Cell 8.

20 For the purpose of analyzing a guideline schedule, one must assume that the incomes fairly present each parent's best efforts. If not, one remedy is for the court to impute more income to that parent in applying the guideline. The guidelines expressly authorize such imputation.

These are difficult cases as to which reasonable people may differ. Both COBS and the updated Income Shares schedule favor the custodial household when both parents have low parental incomes, but neither method adequately addresses the needs of the child in question, as there are insufficient financial resources to meet the needs of the child. In these cases, outside assistance is the only way to improve the children's circumstances; the child support system alone cannot provide the needed help. At least, however, it should not create additional difficulties by setting support at levels that cannot realistically be met by the paying parent. The amounts in Cells 1 and 8 represent an unavoidable compromise between that concern, and concern about the child's financial needs, both embraced by statutory factors that are in these cases necessarily in tension.

2. Cell pairs: examining cases with disparate incomes.

Examining the updated MEG Schedule (Figure 2). Once the equal earner diagonal is fixed, one moves to consider the cells in pairs that present a single total parental income. Cells 10 and 20 provide a convenient example. To ease examination of this example, **Figures 4.1 and 4.2** reprint and enlarge these two cells from the Figure 2 MEG grid. In addition, each benchmark entry is preceded by a letter, (a.) through (i.), which corresponds to the benchmark explanations provided above.

Both cells examine cases in which the parents have a combined income of \$8,000, which is why they are a pair. But these parents are not equal earners. One parent earns \$6,000 and the other parent earns \$2,000. The difference between the two cells is that in Cell 10 (Figure 4.1), it is the custodial parent who earns \$6,000, while in Cell 20 (Figure 4.2) it is the noncustodial parent who earns \$6,000. In each case, of course, the other parent earns \$2,000. From the child's perspective, the two families represented by these two cells were financially equivalent when intact. The *Childshare* analysis, however, shows how they are, far from equivalent for the child after separation.

Figure 4.1 – Cell 10 from Proposed MEG Guidelines

<i>Custodial Parent Gross Income</i>	\$6,000

(f.) % middle income - SOL After support pmt.	87%	165%
(g.) % middle income - SOL Ratio (CP/NCP)	0.525	
(h.) % minimum adequate income – after pmt.	129%	233%
(i.) NCP's Payment Rate		0.13

Both families had the same comfortable middle class living standard when intact, at 154% of the median Arizona family (outcome measure *b*). In Cell 10, the living standard of the custodial household hardly changes after the separation; the figure of 166% (outcome measure *c*) is essentially identical because the noncustodial parent's departure results in a savings greater than the earning contribution of the noncustodial parent. The lower

earning noncustodial household living standard sinks to 71% of that middle class benchmark (outcome measure *a*), having lost the benefit of sharing in the other parent's earnings. (This estimate takes account of the fact that the noncustodial parent has the child 100 days a year, which is why it is lower than the 83% indicated for the single, childless person.) Requiring the noncustodial parent to pay the custodial parent \$91 in support, under the updated MEG schedule, further reduces the standard of living to 67% of the middle income benchmark (outcome measure *f*), taking into account the parenting time. This is actually below the minimally adequate income for a single parent with 100 days of parenting time, at 94% (outcome measure *h*). Put another way, the noncustodial household's living standard falls from 154% of middle income in the intact family, to about 71% after separation, to 67%²¹ after the required payment of \$91, while the custodial household's living standard across this same set of changes goes from 154% to 166% to 169% of the middle income benchmark.

Compare these results to Cell 20, which could be the same family but with a different custodial allocation: the lower earner is now the custodial parent, and the higher earner has 100 parenting days each year. Despite payment of \$601 in child support, the living standard in the custodian's household drops from 154% middle income in the intact family to only 87% of middle income *after* receipt of the support payment. Put another way, two children in financially equivalent households before divorce come out dramatically differently after separation: the child living primarily with the higher earning parent (Cell 10) suffers no decline in living standard at all: for this child the marital living standard has been preserved. By contrast, the child living primarily with the lower earning parent (Cell 20) suffers a large decline in living standard, from 154% of the middle income benchmark to 87%.

This MEG model result fails to meet the mandates of A.R.S. § 25-320(D). Cell 20 (**Figure 4.2**) gives great weight to the noncustodial parent's needs and finances and far less to the child's needs in the custodial parent's home. The outcome from Cell 10 (**Figure 4.1**) does the opposite. In Cell 20 the noncustodial parent benefits financially from the separation; whereas in Cell 10 the custodial parent benefits. While the children in these two families had the same standard of living before separation, because their parents earned the same combined income, they come out very differently after separation. The child who resides with the lower earning parent suffers a dramatic decline in living standard in one family, while in the other the child *benefits* financially from the separation while the noncustodial parent – with whom the child is supposed to spend 100

21 If there are health insurance costs for the child paid by the custodial parent, which are then allocated between the parents, it would result in further reduction of the noncustodial parent's living standard.

days a year – is left with an income that falls short of the “minimally adequate benchmark.

Every cell on the grid outside the equal earner diagonal is a member of a cell pair (identical pre-separation combined income) and similar comparisons can be made between the members of each of these other pairs. The pairs are: 2-7; 3-13, 4-19, 5-25, 6-31, 9-14, 10-7, 11-26, 12-32, 16-21, 17-27, 18-33, 24-34, 28-23, and 30-35. A comparison of the cells in each pair reveals similar results in each case, but the greater the parental income disparity, the greater the disparity between the cells in the child’s outcome. The closer the two parental incomes are to one another, the closer the results are to the reasonable outcomes one sees along the equal earner diagonal. This analysis reveals more systematically that the MEG appropriately addresses the child’s needs when parental incomes are close to one another, but become problematic as the incomes diverge.

To be sure, the child’s interests are not the only interests that must be considered under A.R.S. § 25-320(D), and appropriately so. Because the child and custodial parent share a household, the child’s living standard cannot be separated from the living standard of the custodial parent. When the custodial parent is a low earner and the noncustodial parent earns much more, one cannot set the amount of the support payment with the goal of ensuring the child a decent middle class dwelling without benefiting the custodial parent as well. This unavoidable fact underlines why one must strike a balance among the statutory factors the guidelines must reflect: an exclusive focus on the needs of the child, and on providing the child a living standard at or close to the intact standard, would necessarily give little if any weight to the needs and resources of the noncustodial parent. It would therefore be inappropriate under the statute. Similarly, an exclusive focus on the noncustodial parent’s needs and resources is also inappropriate. Yet an examination of Cell 20, and of similar cells in which the noncustodial parent’s income is much higher than that of the custodial parent, suggests that the Income Shares model gives overriding weight to statutory factor 5. The cause is the marginal analysis that underlies the Income Shares model guidelines, which necessarily overweighs the noncustodial parent’s interests for the cases like Cell 20, for the very reason that it ignores the unavoidable link between the child’s living standard and the living standard of the other members of the same household. Living standard is an attribute of households as whole, not of the individuals within them. The method’s assumption is that the child’s interests are protected when the custodial parent’s share of the marginal expenditures on children in a high-income intact household are added to the post-separation household of the low-income custodial parent, but one can see from this outcome grid that a transfer of the marginal expenditures has a relatively small impact on

living standard of either household while the noncustodial parent's interests are fully protected.

The examination of cell pairs through a series of cases was an effective way of identifying means under which to balance the competing statutory factors, and was one component of the method employed to construct the COBS support schedule.

C. Step 3 – Generating New Numbers

Constructing the COBS schedule.

The task group constructed the COBS schedule through a systematic examination of a series of outcome grids similar to Figures 2 and 3. It started with cases of one child and four sets of incomes for each parent; over time the range of incomes increased and other numbers of children were considered. It began by setting support amounts without consideration of parenting time; using outcome measures that assumed the children lived entirely with the custodial parent. A parenting time adjustment was later added to the system (Step 4). The current guideline for Arizona and for some other states was a reference point at various stages in the process. In general, when beginning with any new grid, the task group worked first on the equal earner diagonal, developing numbers that yielded relatively equal outcomes between the parents.²² This provided a firm basis for setting the amounts in this equal earner diagonal, which then provided a reference point in determining support amounts for the surrounding cells in the grid.

The task group then moved systematically through the cell pairs on the grid. It considered, for each pair, how disparate the situations after divorce should be for children in each situation. Some disparity was inevitable if weight was to be given to the noncustodial parent's needs and finances.²³

22 The GRC made one partial exception to this rule for the case in which both parents were low income, each earning just \$1,000 monthly. In most cases, the household living standards were judged by comparing each household's after-tax income to an after-tax income benchmark. In this case, however, the custodial parent's after-tax income is higher than her gross income, because she qualifies for the earned income tax credit (EITC). In this case, the parent's gross incomes were employed in making the living standard comparison. The effect of this choice was to ensure that the benefit of the EITC was retained entirely by the custodial household: the support obligation, in other words, was not reduced to take account of the EITC enjoyed by the custodial parent. Others may have a different view about this choice.

23 Task group minutes from October 24, 2008 record its consideration of the extreme cell pair in which one parent earns \$10,000 and the other \$1,000. A large disparity in outcome between children depending on which of the parents was the custodial parent was unavoidable if one gave any weight, as one must, to the noncustodial parent's claim on that parent's own earnings. The task group nonetheless concluded that a meaningful reduction of this disparity was appropriate to conform with the statutory mandate that weight also be given to the child's financial needs.

Figures 5.1 and 5.2 are examples of same cell pairs we examined earlier (Figures 4.1 and 4.2) for the proposed MEG guideline--\$8,000 total parental income, split \$6,000 earned by one parent and \$2,000 by the other. Figures 5.1 and 5.2 examine cell pairs using the COBS calculation. Under COBS the higher earning parent's household retains a living standard advantage after separation, for both figures (as is appropriate under the statutory factors); the

COBS calculation considerably reduces (as compared to MEG) the difference between these two families in the outcomes for their children (children who had identical pre-separation living standards). To accomplish this, for the case in which the noncustodial parent is the higher earner, (the case portrayed in Figure 5.2) the noncustodial parent pays a higher support amount than under MEG. But despite this, the higher-earning noncustodial parent suffers very little decline from the intact family living standard (from 154% to 149% of the middle class benchmark)—but unlike the situation under MEG, the noncustodial parent does not *gain* in living standard from the separation. (Under MEG, the separation advances the higher earning noncustodial parent from 154% to 165% of the middle class benchmark—*after* considering their support payment.) The custodial household where the child spends the majority of time now has a living standard after the support payment, just at the middle class benchmark (100%) - still a decline from the intact family level of 154% percent, but far better than the 87% under MEGS. For the case in which the custodial parent is the higher earner (Figure 5.1), the basic COBS calculator yields a negative payment. Even after making this payment, the custodial household is better off after separation than during the intact relationship (159% of the middle class benchmark, as compared to 154% during the marriage), while the low income noncustodial household, where the child will spend 100 days a year, no longer falls below the minimally adequate income, as happens under MEG. (Note, however, that this negative payment is an interim calculation, because under the complete support guidelines (both MEG and COBS) medical costs, and the child care costs, must still be accounted for. It is likely that the negative payment will disappear as a credit against those obligations, and even if some of it remains, it would not ordinarily survive the guideline presumption against negative payments to a noncustodial parent who has the child for less than 120 days.)

Proceeding in this way through a series of cell pairs, the task group initially produced support amounts for 16 cases in which the noncustodial parent and custodial parent had gross incomes of \$1,000, \$3,000, \$6,000 or \$10,000, and had only one child. Over time, and in consultation with Dr. Barnow, these one child amounts were extended to 2, 3, and 4 children. Extrapolations from these anchor points provided by the task group were then generated by Dr. Barnow, producing a larger support grid. These tentative grids were then reviewed for anomalies by constructing charts that allowed one to examine and compare changes in the support amounts with changes in custodial parent income, noncustodial parent income, and number of children. Some anomalies were found in this first review, support amounts were adjusted to eliminate them, and the same review for anomalies was then repeated. This process ensured that the grids made sense as a whole, and were not merely a collection of judgments about individual cells. After several iterations of this process, the task group finalized basic grids covering the income range of \$1,000 to \$10,000 for each parent, and for 1, 2, and 6 children. Dr. Barnow then produced interpolations for 3, 4, and 5 children. Discussions with the GRC

also yielded changes, as different decisions were made over time concerning the income range and number of children that the new schedule should address.

D. Step 4 - The Parenting Time Adjustment

Arizona's current guidelines contain a parenting time adjustment, as A.R.S. § 25-320(D)(8) would appear to require. The existing parenting adjustment depends upon calculations that begin with the numbers contained in the Table of Basic Support Obligations. Applying that method to the new COBS numbers would not have been appropriate. It was therefore necessary to devise a new method for calculating the parenting time adjustment, based on support numbers generated by COBS. There has in any event been some interest in giving the current parenting time adjustment more thought, as it has not been reexamined since its initial adoption in 1996.

The difficulty in formulating any parenting time adjustment lies in the distinction between variable costs and duplicated costs. Variable costs include items like food for which the cost travels with the child. They are proportionate to the time the child spends in a parent's household. When a child spends 30% of his or her time with one parent, that parent incurs 30% of these variable costs, and the other parent saves those same costs. Duplicated costs, by contrast, represent an increase in the total expenditures on the child made necessary by the parenting time arrangement. They are called duplicated costs because while they are incurred by the noncustodial parent, that parent's expenditure does not result in any corresponding saving by the custodial parent. For example, the noncustodial parent may incur costs in providing the child a private bedroom, but there is no corresponding saving in the custodial parent's housing costs. As time with the noncustodial parent increases, there may also be duplicated expenses for toys, clothes, sports equipment, and other items that do not reduce the custodial parent's expenditures. While it seems appropriate to reduce the support amount dollar for dollar by the variable costs shifted to the noncustodial parent, a different treatment would seem necessary for duplicated costs.

It is generally believed that a noncustodial parent does not incur any duplicated costs until parenting time exceeds some threshold. For example, a parent who has the child for only two overnight stays a month may be unlikely to dedicate a room in that parent's home exclusively for that child's use. On the other hand, a parent may incur most if not all the possible duplicated costs as parenting time moves closer to equal. The adjustment should ideally reflect this as well. In contrast, variable costs can be treated as proportional to parenting time through the entire range of possible parenting time allocations.

Arizona's current parenting time adjustment does not attempt to make these distinctions on its face, but they do appear to have influenced the design of

Table A in the current guidelines, the mechanism through which the current adjustment is made. That table reduces the support amount by a percentage of the Basic Support Obligation that increases with the number of parenting days allocated to the noncustodial parent. The parenting days are grouped into 13 categories with a single percentage associated with each category. The categories include a range of days that may be as small as nine (such as 143 to 152 parenting days) or as large as 27 (88 to 115 days). Nor does the percentage advance in equal increments as one moves from the fewest to the largest number of parenting days; the increase between categories is greater at some points than at others. This design likely reflects the belief that the noncustodial parent is more likely to incur additional duplicated costs at some points than at others. Because the system is designed with break points, significant changes in the support obligation can occur when the number of parenting days increases by as little as a day or two and crosses into the next parenting adjustment category. On the other hand, of course, there are no changes in the support amount for changes in the number of parenting days within any category.

If Table A was meant to capture the full amount of parenting time costs, both variable and duplicated, it did so by charging *all* the duplicated costs to the custodial parent, since they yield a dollar for dollar reduction in the support obligation. This would not be appropriate. At the same time, the use of parenting time categories rather than a continuous curve yields an inappropriate accounting of the variable costs, which change continuously.

The task group concluded that the need for a new parenting time adjustment to work with the COBS system was an opportunity to design an adjustment that dealt more effectively with the difference between variable and duplicated costs. From the perspective of the user, the new system is very simple: the user inputs into the support calculator the gross incomes of each parent and the number of parenting days assigned the noncustodial parent, and the calculator returns an unadjusted support amount, the parenting time adjustment, and the final adjusted support amount. Behind this simple interface the calculator implements a parenting time adjustment built on these basic assumptions and principles:

1. The total costs²⁴ to be allocated consist of half variable and half duplicated costs. There are no definitive data on this allocation, but

24 The total costs for any particular set of parents are the marginal costs of adding a child to the household—it is these marginal costs which are affected by the parenting time arrangement. This is also the implicit view in the current system, which applies the percentages in Table A to the Table of Basic Support Obligations, which is of course a table of marginal cost estimates. To find the marginal costs implicit in the COBS system, one consults the unadjusted support amount the COBS calculator returns for equal-earning parents whose total income is identical to the total income of the two parents in question. Because this support amount is meant to equalize the living standards of the two post-separation households, it is implicitly an estimate of one-half of the marginal costs of children in a family with that total income. (One-half because the actual marginal cost estimate is the difference in the post-payment incomes of the two

there are helpful sources to guide this choice on which the Guidelines Committee relied, and which all suggest an equal division. They include recent findings employing data generated by the Department of Agriculture,²⁵ and the study done for the 1996 Guidelines Review Committee that first adopted a parenting time adjustment.²⁶ It is also the case that several other states which make the distinction between variable and duplicated costs also assume an equal allocation of variable and duplicated costs.²⁷

2. The variable costs are proportional to parenting time and yield a dollar for dollar reduction in the support amount because they reduce the costs of the custodial parent.

3. No duplicated costs are incurred until the noncustodial parent has the children for at least 55 parenting days (15% of the total). The full amount of duplicated costs is incurred when the noncustodial parent has the child for 164 parenting days (45% of the total). Duplicated parenting costs increase in a straight linear function as the noncustodial parent's time increases from 55 to 164 parenting time days.

4. Because the total amounts of the duplicated costs incurred are an additional cost generated by division of the child's time between two households, they should be allocated between the parents in proportion to their incomes. Thus, if the noncustodial parent earns

households.) The COBS calculator begins its calculation of the parenting time adjustment by finding the support amount for the equal-earning couple with the same total income as the inputted case, and doubling it. This is the total cost figure that the remaining calculations are applied to.

25 Braver, S. L., & Stockburger, D., *Child support guidelines and equal living standards*, in W. S. Comanor (Ed.), *THE LAW AND ECONOMICS OF CHILD SUPPORT PAYMENTS* 91-127 (2004). Cheltenham , UK : Edward Elgar. Braver examines child rearing costs compiled by Mark Lino of the U.S. Department of Agriculture and classifies them into four categories, including variable and "duplicatable"—what we here described as "duplicated." The other two categories of costs are irrelevant to the parenting time adjustment because they are dealt with and assigned by the guidelines in other ways. This includes, e.g., costs that are neither variable nor duplicatable, such private school tuition or health insurance. The cost share estimates per category that Braver reports do vary with total household income, but no effort was made to refine the calculations here to reflect these relatively small differences; such an adjustment would seem to presuppose an unrealistic level of precision in these estimates. The average share per category across incomes indicated that the variable and duplicatable costs are approximately equal.

26 James Shockey, *Determining the Cost of Raising Children in Nonintact Arizona Households*, study presented to the Arizona Judicial Council, February, 1995. Shockey's estimates are quite similar to Braver's, and like his, include cost categories that are neither variable nor duplicatable. But his estimates show the relatively proportions of variable and duplicatable are about the same.

27 According to a recent report regarding the State of Oregon, 19 states employ a "cross credit" system for their parenting adjustment, which requires them to estimate the duplicated costs that are generated by the parenting arrangement. Seventeen of these 19 states estimate them at 50% of the total marginal costs in an intact family, leaving 50% for non-duplicated or variable costs. Policy Studies Inc., State of Oregon Child Support Guidelines Review, 2006, at page 24. The Oregon report is available on the web at: http://dcs.state.or.us/Oregon_admin_rules/psi_guidelines_review_2006.pdf

60% of the income, that parent is responsible for 60% of the duplicated costs incurred, and that parent's support obligation is reduced by the 40% of the duplicated costs for which the custodial parent is responsible.

Example: Suppose mother is the custodial parent, but father has the child 25% of the time. First, the calculator looks up the total amount typically spent on children by parents whose total income is the same as this mother and father, and who have the children all the time. Suppose that's \$200. The calculator then divides those costs in half, because on average, half the costs are variable and half are duplicated. So in this example, there are \$100 of variable costs and \$100 of duplicated costs. Because father has the child 25% of the time, his variable costs are 25%.

What about the duplicated costs? A parent who has the child 25% of the time will not normally incur the full amount of duplicated costs. That parent will spend money for some of them, but not all of them. The calculator assumes that if father has the child less than 15% of the time, that parent spends no money on duplicated costs, but if he has the child for 45% of the time or more, he incurs all the duplicated costs. The calculator also assumes that the amount father spends on duplicated costs increases proportionately as one goes from 15% to 45%. So in this example, where father has the child for 25% of the time, he will incur one-third of the total possible duplicated costs (because 25% is one-third of the way from 15% to 45%). One-third of \$100 is \$33. If mother earns 40% of the parents' income, then she should pay 40% of the duplicated costs that father incurs. Forty percent of \$33 is \$16.

Therefore, in this example, the total parenting adjustment is \$25 plus \$16, or \$41. The calculator automatically reduces the support amount that father would otherwise be asked to pay mother by \$41.

E. Step 5 - Final Adjustments, including comparisons of the results to the guidelines of other states.

As previously noted, this was an iterative process. The task group generated support grids, which were then submitted to Dr. Barnow. After receiving feedback from Dr. Barnow and the GRC, appropriate revisions were made. Once this process produced sufficient entries in the working support grid, Dr. Barnow extrapolated from them to create a large grid of support amounts covering the full range of incomes. The parenting time adjustment was then calculated for a series of the most common cases to obtain a final support amount that could be compared to the amounts that would be obtained by applying the current Arizona guidelines, the updated guideline schedule, and the support amounts that would be obtained by applying the guidelines of a number of other states. This table is contained in **Appendix H, Table 2**.

III. Overall Patterns in the Differences Between the Two Systems

When considered in concert, **Figures 2 and 3**, allow for comparison between COBS and the updated MEG model over a range of cases. That comparison reveals that COBS results in a lower support amount than the updated MEG schedule in all cells to the right of the equal earner diagonal, in which the custodial parent is the higher earner, and higher support amounts for cells to the left, in which the noncustodial parent earns greater income. The two systems come closest to one another along the equal earner diagonal itself, although COBS yields slightly higher support amounts for two highest income cases on the diagonal (cells 29 and 36) but MEG model yields higher support amounts for the other four cells along the equal earner's diagonal. (Cells 1, 8, 15 and 22) Generally, the higher earning parent derives greater financial benefits under MEG, while the lower earning parent derives greater financial benefits under COBS. This is true whether the higher earner is the custodial or noncustodial parent. Moreover, the greater the income disparity between the two parents, the greater is the difference between the support amounts required by the two systems.

This pattern of change effected by the COBS system is responsive to the concerns that led to the creation of the Interim Committee and its conclusions about needed changes. The consensus then was that the support amount under the current guidelines was not problematic when the two parents' incomes were close to one another, but were inadequate when the noncustodial parent earned significantly greater income. The changes made by the COBS system address these concerns. The Appendix contains two comparison tables. *The Child Support Ranking Chart, Table 2, Appendix H*, compares for 31 different cases, COBS, the updated Income Shares schedule, and the current Arizona guidelines to the support amounts called for under the guidelines of four other states: Massachusetts, which just this year reaffirmed its distinctive guidelines in a very comprehensive review; Iowa, a MEG Income Shares state with guidelines that yield support amounts that are roughly at the median among MEG Income Shares states (neither particularly high or low), Oregon, a MEG Income Shares state which revised its guidelines two years ago, and Wisconsin, the originator of the POOI system, to which it still adheres. *The Child Support & Standard of Living Comparison Chart Table 1, Appendix G*, provides the percentage change from the current Arizona guideline amount to the COBS amount. **Table 1** provides an important tool for comparing the proposed COBS guideline with the proposed MEG and the current MEG. For each of the same 31 examples considered in **Table 1**, compare these three systems to one another by reference to the important outcome benchmarks that track the standards A.R.S. § 25-320(D) directs be the basis of the guidelines.

Several further facts become apparent from *The Child Support Ranking Chart, Table 2*.

Of the 31 examples compared in Table 2 COBS does not result in being the highest support amount among the considered systems. If one focuses on the five cases in

which COBS calls for the greatest percentage increases over current Arizona guidelines--Lines 3, 7, 11, 17, and 29--one can see that in three of them, both Massachusetts and Wisconsin would require the noncustodial parent to pay more than COBS (lines 3, 17, and 20), while only Massachusetts require a higher support amount in Line 11, Wisconsin's guideline calls for essentially the same amount as COBS (\$971 versus \$982). Line 7, which considers the case in which the noncustodial parent earns \$4,000 a month and the custodial parent earns \$1,000, yields the smallest percentage increase over the current guidelines among this group of five, although the increase is still substantial (55%). COBS calls for a support payment of \$784, as compared to the \$546 that would be required in the updated MEG schedule, while Massachusetts would require \$979 in its new guidelines (raised from \$911 in the guideline effective through 2008). This is an important example because the total parental income (\$5,000) puts the intact family at almost exactly the middle class benchmark (102%). To illustrate the differing results, compare the outcome measures for COBS and the updated MEG model for this example by looking at Cell 13 in **Figures 2 and 3**.

Under the MEG model the custodial parent's household falls to 57% of the middle class benchmark, and to only 86% of *minimally adequate* income. At the same time, the noncustodial parent's household, after the support payment and taking into account the costs associated with 100 days' of parenting time, is at 109% of the middle class benchmark. The result is a steep drop in the living standard of the custodial parent's household but no loss in living standard at all, and perhaps some slight gain, for the noncustodial parent.

The COBS result is different. The custodial parent's household still suffers a drop in living standard to 66% of the middle class benchmark, but it is less, and it does at least achieve a minimally adequate income (98% of this benchmark). The noncustodial parent maintains a middle class living standard (98%) after the support payment, thereby impacting far less the result for the noncustodial parent. The GRC concluded the COBS result is a more appropriate balance of the statutory factors. It allows the noncustodial parent to retain an important portion of the financial advantage associated with higher earnings but also protects the custodial household from falling below a minimally adequate income, while also weighing the financial resources of the custodial parent and needs of the child.

A final difference one must note is that for the cases in which the custodial parent has significantly more income than the noncustodial parent, the COBS calculator yields a negative support amount. The existing Arizona system also yields negative amounts in some cases, as does the Wisconsin calculator, but COBS does so in a larger group of cases and, at least sometimes, for greater amounts. As the accompanying text of the guidelines point out, these negative amounts can be rounded to zero in most cases, as they typically are when they arise today. But support payments from the custodial parent to the noncustodial parent become increasingly appropriate as the income advantage of the custodial parent increases and the difference between the parents' shares of parenting day's decreases. **Line 28 of *The Child Support Ranking Chart***

(Table 2, Appendix H), for which both COBS and Wisconsin require a negative payment, is a case in point: it does not often arise, but a payment from the custodial parent to the noncustodial parent is apt when it does. While this particular example is not included among the cases for which outcome measures are presented in **Figures 2 and 3**, a close but less compelling illustration is provided in Cell 18 (**Figures 2 and 3**) in which the custodial parent earns \$10,000 and the noncustodial parent earns \$4,000. The \$238 payment that COBS calls on the custodial parent to make to the noncustodial parent leaves the custodial parent with a household living standard unchanged from when the family was intact, at 252% of the middle class benchmark, and allows the noncustodial parent a living standard of 142% of the benchmark—considerably less than during the marriage but still comfortably middle class.

The updated MEG, by contrast, requires the noncustodial parent to pay \$173 to the custodial parent, accelerating considerably the decline from the intact living standard. For the case in Line 28 of Table 1 the same except that the noncustodial parent earns \$3,000 rather than \$4,000, the outcome measure would be more persuasive. It is noted that *both* parents are taking both financial and nonfinancial responsibility for their children when one has them for 100 days a year and the other has them for 265 days. It remains the goal for there to be an environment for the children in both parental households that is reasonable in light of the parents' incomes. On the other hand, a support payment to the noncustodial parent with 100 days of parenting time may seem difficult to accept. The guidelines therefore allow rounding to zero in these cases. But once the noncustodial parent has the children for at least 120 days—about one-third of the year—the result that is most consistent with the statutory factors is for payments to be made by the higher earner to the lower earner when the parental incomes are significantly disparate.

PHASE I - UPDATING THE INCOME SHARES MODEL

The Administrative Office of the Courts contracted with the Center for Policy Research to conduct the traditional Income Shares model schedule update and case file review. The Center for Policy Research provided the Child Support Guidelines Review Committee (GRC) with a report written by its consultant, Dr. Jane C. Venohr, entitled *Basis of an Updated Child Support Schedule for Arizona (2008)*. Consistent with the Income Shares model utilized in Arizona, the report relies on estimates of marginal expenditures on children in intact families provided by David Betson.

Arizona's current guidelines are based on Betson-Rothbarth estimates of marginal expenditures on children using data on families of child-rearing age in the 1996-99 Consumer Expenditures Survey (CES), updated to 2002 price levels using the Consumer Price Index. The proposed updated schedule relies on Betson-Rothbarth estimates from data from the 1998-2004 surveys, updated to 2008 price levels using the Consumer Price Index. Because Arizona uses a gross income schedule, assumptions must also be made to convert gross to net income in estimating total expenditures, and the updated schedule relies on 2008 withholding formulas for this purpose.

The updated schedule yields some increase in support levels above those required in current guidelines. **Figures 6.1, 6.2, and 6.3 (one, two, and three children)** compares the support amounts over the full range of parental incomes, for the cases of one, two, and three children, which constitute nearly all support cases.

Figure 6.1 – One Child

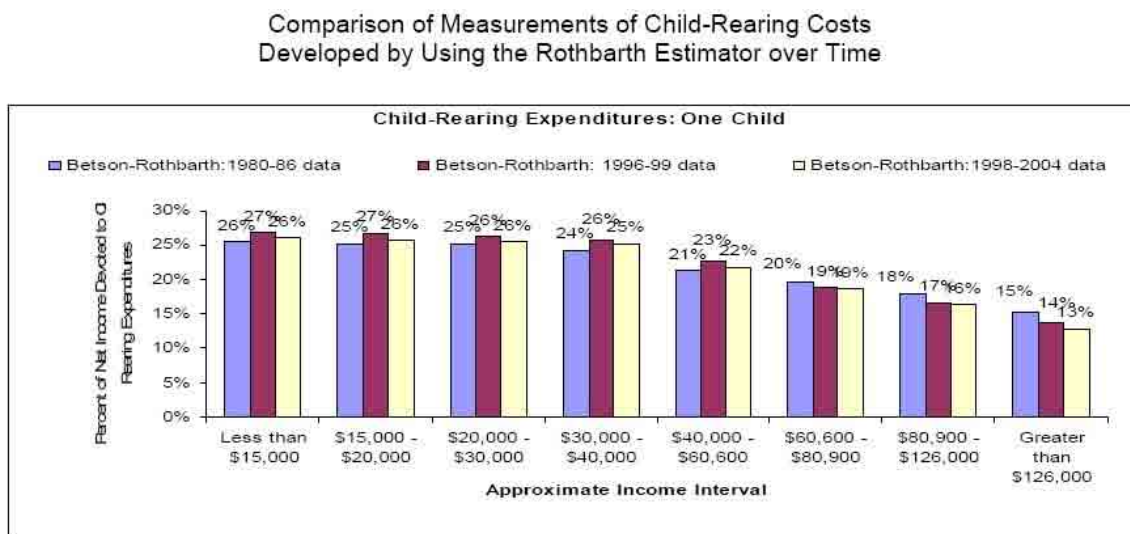

Figure 6.2 – Two Children

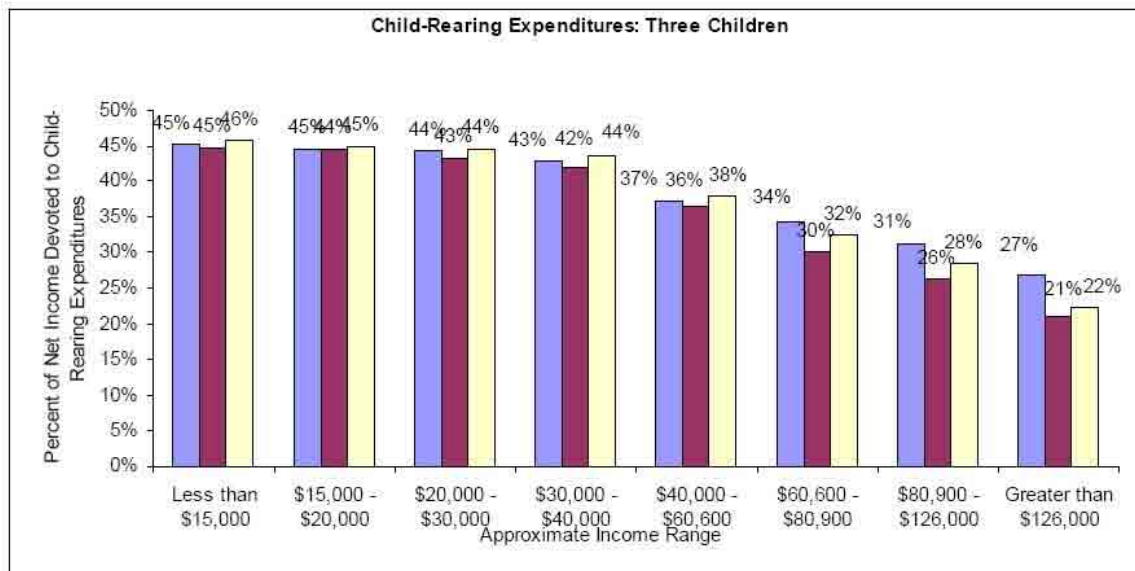

Figure 6.3 – Three Children

Center for Policy Research consultant, Dr. Jane C. Venohr provided the Guidelines Committee with three reports:

1. *Basis of an Updated Child Support Schedule for Arizona (2008)*
2. *Arizona Child Support Guidelines Review; Analysis of Case File Data*
3. *Data Collection Plan: Case File Review for the Arizona Child Support Guidelines Review*

I. Basis of an Updated Child Support Schedule for Arizona 2008

Center for Policy Research's Conclusions

Dr. Venohr concluded that price increases and other economic changes warrant an update to the schedule. Currently, the Arizona schedule is based on 2002 economic data. For the most part, the recent economic data produced increases to the schedule as noted below.

- The new estimates of child-rearing expenditures combined with changes in average expenditures on child care and out-of-pocket medical expenses result in an average increase of six percent. The change varies by income range and number of children.
- Changes in price levels have resulted in an 11 percent increase on average. Actual price levels have increased by 20 percent since the existing schedule was developed, but the impact on the schedule is less because income has essentially increased, too. Price changes have a larger impact on higher incomes than lower incomes.
- Federal tax reform in 2003 makes more after-tax income available for child support. It produces a two percent increase to the schedule on average. The tax effects are the highest around combined gross incomes of \$3,500 per month and at very high incomes.

When combined, the average increase is 15 percent. It is not equivalent to the sum of its parts (i.e., the average increases bulleted above) because the percentage change varies by income range and number of children.²⁸ (**Appendix C.**)

Dr. Venohr also commented on the impact of future tax changes promulgated under the Jobs and Growth Tax Relief Reconciliation Act of 2003, which will rescind in 2010. Dr. Venohr noted that Congress and President Obama indicate they will make the decrease permanent for most incomes; however, President Obama proposes an exception at very high incomes. Dr. Venohr estimates, based on the current proposal, that tax changes would decrease the schedule amounts above \$20,000 per year by about one percent.

Because the new data include more high-income families, the highest combined income in the schedule increased from \$20,000 to \$30,000 gross per month.

Exhibit 13²⁹ (below) summarizes the average changes to the schedule by number of children. Exhibit 13 considers changes to the basic obligations before they are prorated between the parents and before other factors are considered such as parenting time, child care expenses and health insurance. As evident, on average, the update produces higher basic obligations. Only one part of the update indicates a decrease to the basic

28 Venohr (2008), *Basis of an Update Child Support Schedule for Arizona*. Report located at: <http://supreme.state.az.us/csgrc/Documents/2009-Basis.pdf>

29 Venohr (2008), *Basis of an Update Child Support Schedule for Arizona*. Report located at: <http://supreme.state.az.us/csgrc/Documents/2009-Basis.pdf>

obligations. There is an anomaly for one child at gross incomes of \$1,000 to \$2,250. The new data indicate nominal decreases of \$1 to \$4 per month to the basic obligation at this income range. Dr. Venohr believes this part of the decrease is “due to capping family expenditures so they do not exceed income. The data suggest that low-income families spend more than their income. However, in developing the child support schedule, we cap expenditures to income, so the guidelines do not expect parents to spend more than their income.”³⁰

Exhibit 13 Summary of Changes to Basic Obligations in Schedule (Note that this is the combined increase, the actual increase in order amounts will be less due to the obligated parent's prorated share)			
	1 Child	2 Children	3 or More Children
Percent of Orders (from case file review) ³⁵	52% of orders	35% of orders	14% of orders
Percentage Change			
• Average	6%	13%	18%
• Median	6%	14%	19%
Dollar Change			
• Average	\$ 69	\$195	\$350
• Median	\$ 70	\$197	\$356

II. Arizona Child Support Guideline Review: Analysis of Case File Data **Findings and Recommendations**

According to state statute and federal regulation³¹, the states must analyze case data...

“...gathered through sampling or other methods, on the application of, and deviations from, the guidelines. The analysis of the data must be used in the State’s review of the guidelines to ensure that deviations from the guidelines are limited.”

This was Arizona’s fourth case file review since the quadrennial review requirement was first imposed in 1989. The previous reviews took place in 1995, 1999, and 2002. The 2002 report contains findings from both the 1999 and 2002 reviews, which was relied on in this report to analyze trends in child support orders and guidelines usage.

Sample Size

The 1999 and 2002 reviews relied on a sample of 267 orders and 431 orders respectively. The sample size necessary to detect statistical differences in the guidelines deviation rate since 2002 is 270 orders.³² Nonetheless, this study targeted a sample size of 440 orders to be comparable to the 2002 sample size. CPR oversampled by 25 percent, then rounded up the sample size when distributing it across counties and county offices. The total targeted sample size was 615 orders. **Exhibit 1**, below, shows the targeted sample size for each county, the actual sample size, and other information.

Exhibit 1: Sample Selection						
	Apache County	Maricopa County	Pima County	Yavapai County	Subtotal of the Four Counties	State Total
Total population (2007 Census)	71,118	3,768,123	946,362	208,014	4,993,617	6,166,318
% of State Total	1.2%	61.1%	15.3%	3.4%	81.0%	100.0%
New Orders Established by IV-D Agency (FY2007)	36	4,162	1,201	332	5,731	7,702
% of State Total	0.5%	54.0%	15.6%	4.3%	74.4%	100.0%
Child Support Orders Entered (2007 County Clerk Records)*	68	6,935	1,911	407	9,321	Unknown
Targeted Sample Count	30	410	120	55**	615	Not Applicable
Actual Sample County	27	385	110	46	568	Not Applicable

*Includes IV-D and non-IV-D orders. IV-D refers to Section IV-D of the Social Security Act that requires states to develop a child support program to establish and enforce support in public assistance cases and make these services available to non-public assistance cases. Maricopa County includes modified orders. Pima County is estimated based on cases filed in 2007.

**This is broken down into two locations: Prescott (35 cases) and Verde Valley (20 cases).

31 Arizona Revised Statutes § 25-320(D) and Title 45, Public Welfare, CFR 302.56.

32 Four counties were sampled: Maricopa County, Pima County, Yavapai County and Apache County.

**Summary of Findings from the
Analysis of the Case File Review³³**

A. CHARACTERISTICS OF THE CASES

- As in the previous case file reviews, the majority of parents who make child support payments, or the “obligors” in the case, are male (87%).
- 84% of the sample consists of “traditional” child support orders, where one parent is the primary residential parent and the other parent owes support.
- 15% of these orders involve essentially equal parenting time.
 - 76% are cases where the father has more income and would be the obligor under strict application of the guidelines.
 - 18% are cases where the mother has more income and would be the obligor.
 - 3% involve parents with equal incomes.
 - 3 % are orders where additional expenses alter which parent would pay support under strict application of the guidelines.
 - 1% involve split custody, where there are at least two children and each parent is the primary residential parent for at least one child.
- 87% of the cases reviewed covered one or two children.

B. PARENTS’ INCOMES

- Average gross monthly incomes of obligees and obligors have increased since the previous case file review. This appears to result from an increase in the proportion of high earners. The percent of parents with gross incomes above \$3,000 per month has increased significantly. In 2002, 36% of obligors had gross incomes more than \$3,000 per month. In 2007, that proportion has grown to almost half, 48%
- The number of obligees and obligors earning less than \$1,000 per month has decreased since 2002. Some of this decrease may result from the change in Arizona’s minimum wage.
- It is unusual for both parents to have high incomes. 4% of the obligees and 13% of the obligors have gross incomes more than \$6001 per month. Only 2% of orders involve cases where both parents have gross incomes above \$6,001 (or combined incomes above \$12,001 per month.)
- Approximately 2% of the 2007 sample have a combined gross income over \$20,000 per month. This is important because Arizona’s current guidelines’ schedule does not cover combined incomes over \$20,000 per month.

33 For more detailed findings and explanations see *Child Support Guidelines Review, Analysis of Case File Data* located at: <http://supreme.state.az.us/csgrc/Documents/2009-CaseFileRev.pdf> or see **Appendix D**.

- The obligor's income is approximately 60% of the combined income in the 2007, 2002, and 1999 samples.

C. MONTHLY ORDER AMOUNTS

- In 2007, the average child support order is \$460 per month. Slight increase from 2002 and 1999 averages, which were \$455 and \$447 respectively. 39% of the orders in 2007 were set at amounts over \$500 per month.
 - 80% of these orders were between \$500 and \$1,000 per month, while 20% of these orders were over \$1,000 per month.
- Of the orders below \$100 per month, 89% are less than \$50. These orders make up 16% of the total sample. This is a statistically significant increase from the 2002 and 1999 samples, where orders under \$50 per month made up only 6% and 1% respectively, of the total sample.
- Zero-dollar orders have increased since the last review. In 2007, these orders are 14% of the total sample, while in 2002, these orders made up only 5% of the total sample. This increase is statistically significant.
- 26% of the zero-dollar orders followed the guidelines.
- 74% of all zero-dollar orders result from guidelines deviations.
 - 53% involve essentially equal parenting time.
 - 48% of zero-dollar orders based on a deviation started with a guidelines calculated amount of \$100 or less.
 - About 33% involved cases where the obligor's income was less than or equal to the obligee's income or the obligor's monthly income was less than \$2,400. This suggests that the parents may have agreed to a zero-dollar order to increase the obligor's self-support reserve.

D. APPLICATIONS OF ADJUSTMENTS

- A parenting time adjustment was applied in 88% of the cases in the 2007 sample. This is a statistically significant increase from 2002, when 77% of the cases had a parenting time adjustment applied.
- None of the worksheets in the 2007 sample noted use of Table B³⁴, nor did any in the 2002 review.
- 17% of the cases with a parenting time adjustment use an adjustment of 173 to 182 parenting days per year.
 - 78% were equal parenting time cases.

34 Parenting Time Table B is explained in the current (effective date of January 1, 2005) guidelines as follows: "As the number of parenting time days approaches equal time sharing (143 days and above), certain costs usually incurred only in the custodial household are assumed to be substantially or equally shared by both parents. These costs are for items such as the child's clothing and personal care items, entertainment and reading materials. If this assumption is rebutted by proof, for example, that such costs are not substantially or equally shared in each household, only "Parenting Time Table B" must be used to calculate the parenting time adjustment for this range of days."

- 21% of the cases are based on the 88 to 115 day range.
- 15% of the 2007 sample involved cases with essentially equal physical custody, which is significantly more than the 2002 sample.
- Less than 5% of the obligors received the low-income adjustment. This is slightly less than the 6% of obligors that received the adjustment in 2002.
- Nearly 65% of the cases have an adjustment for a child's medical insurance. The 2007 average adjusted amount for medical insurance is \$132.
- On average, obligors spent approximately 3.5% and obligees spent 4.9% of their gross income on medical insurance for their children.
- 83% of the obligors and 70% of the obligees who paid for insurance spent less than 5% of their gross income on medical coverage. This is important because in July of 2008, the federal government passed new medical support rules that defined medical insurance as reasonable in cost if "the cost to the parent responsible for providing medical support does not exceed five percent of his or her gross income, or at State option, a reasonable alternative income-based numeric standard defined in State law."³⁵
- 35% of the cases include an adjustment for child care costs. On average, the adjusted amounts for child care costs are \$412 a month in the 2007 sample.
- In the past three case file reviews, only 4% of the cases include an adjustment for education expenses. The average adjusted amount is \$327 in the 2007 sample.
- Only 1% of the cases included an adjustment for special needs children. The average cost adjustment in the 2007 sample was \$80.

E. DEVIATIONS FROM THE GUIDELINES

- Arizona has a 26% deviation rate.
 - 77% of the deviations were the result of a written agreement between the parents. In these cases, 66% of the deviations were in a downward direction.
 - If rounding-error is not considered to be a deviation, the deviation rate would be 21%.³⁶
 - In 33% of deviated orders, parenting time was essentially equal.
 - In 71% of these cases, the order was deviated downward to zero.
 - In 24% of deviated orders it appeared that an upward deviation was made because the obligee had relative low income, (less than \$2,500 gross per month) or because the obligee had more income than the obligor.
 - Equal parenting –time cases with deviations comprise 8% of all orders; low-income obligee cases with deviations comprise 6% of all orders; low-income obligor cases with deviations comprise 3% of all orders.
 - Equal parenting-time cases that deviated to a zero order comprises only 6% of the total 2007 sample.

³⁵ 45 CFR§303.31(a)(3) Federal Register, vol. 73, No.140 (July 21, 2008, pages 42416-42442).

³⁶ The Guidelines Committee has addressed the resulting over calculation of deviations by noting that the rounding off of the support amount for administrative convenience does not constitute a deviation from the guidelines. (See Section IV(A)(3)(b) of the proposed Guidelines.)

- In the 2007 sample, 74% of obligees and 53% of obligors attended a parenting education class. More obligors attend parenting education when they have equal timesharing or when the order amount deviated from the guidelines.

**Recommendations from
*The Analysis of Case File Data***

Based on the analysis, the following recommendations were made:

- **No changes to the deviation criteria;** however, it was suggested that the GRC should consider whether these cases could be better addressed through changes to Paragraph 12 (Equal Custody) or the worksheet forms; and, contemplate the appropriateness of zero-dollar orders.
- **Changes to the standardized order and worksheet forms.** Counties should be encouraged to develop gender-neutral order forms and should allow the user to circle either the “mother” or “father” as the obligor, rather than presume father is the obligor. On the guidelines worksheet, counties should be encouraged to adopt “the primary residential parent” language rather than ask which parent is the “custodial parent.” The section of the guidelines worksheet that indicates whether Parenting Time Table A or B is applied should be expanded to note whether Paragraph 12 is applied.
- **Simplify the parenting time adjustments for use by unrepresented parents.** Recommends the GRC review the intent of the three different ways to adjust for parenting time under the guidelines, modify them as they deem appropriate, and provide better direction on which adjustment to use. This may help reduce the number of deviations among equal timesharing cases. One point of confusion is that Paragraph 12 is to apply to “essentially equal” parenting time, but Table A presumes that child-rearing costs are substantially or equally shared in each household when the obligor has at least 143 parenting days. This could be interpreted that either Table A or Paragraph 12 could be applied to cases with 143 parenting days. The increasing trend of essentially equal parenting cases heightens the need to clarify these adjustments.
- **Either make Parenting Time Table B easier to apply or eliminate it.** Table B provides appropriate support awards when there is equal timesharing but not equal cost sharing; that is, one parent may incur more of the child’s clothing expenses than the other parent. Based on the case file review, it is never applied. The Guidelines Committee should review Table B to determine its purpose and whether it is fulfilling that purpose.
- **Consider the findings when developing a threshold for determining reasonable costs of health insurance.** The GRC should consider the findings from the case file review that suggests that a standard lower than five percent would likely result in private insurance being reasonable in cost in fewer cases.
- **Consider ways the guidelines can better address cases with combined adjusted gross incomes above \$20,000 per month, the highest on the**

schedule. The GRC may want to consider extending the schedule to higher incomes, adopting a formula for incomes above the schedule, or eliminating the criterion that the obligee bears the burden of proof that a higher amount is appropriate. Most other states guidelines do not require the obligee to bear the burden of proof; rather they allow for a higher amount under court discretion.

- **Review the reasons for an increasing trend in zero-orders and consider their consequences; specifically, whether they may require changes to the guidelines or other recommendations.** Zero-dollar orders comprise 14% of the 2007 sample, which is significantly more than the 2002 sample and about half of these orders involved guidelines amounts of \$100 or less before the deviation was made and many involved essentially equal parenting time. Zero-orders are appropriate in equal parenting time and equal income cases.

The proposed guidelines include the GRC's efforts to address and incorporate the issues and recommendations presented to the committee by Dr. Venohr.

SUMMARY OF RECOMMENDATIONS

At the outset of its work, the Child Support Guidelines Review Committee (GRC) identified three general tasks to be undertaken during its tenure.

The GRC focused on updates and changes to the law impacting child support for the period that followed the predecessor guidelines. This included changes in state and federal law and regulations as well as a review of appellate court decisions. These guidelines incorporated the impact thereof on the guidelines.

The GRC further identified that the 2005 version of the guidelines reflected an on-going compilation of changes and supplements as the guidelines evolved from each quadrennial review. The GRC undertook the task of consolidating and re-organizing the guidelines so as to create a more user-friendly product.

A draft of the proposed revisions to the Arizona Child Support Guidelines and the proposed child support calculator associated with the Child Outcome Based Support guideline model are incorporated in **Appendices E and F**, respectively.

There has been consensus that the shortcomings or misapplication of economic data as a foundation for calculating child support had to be addressed. The GRC strongly endorses the use of the Child Outcome Based Support Model to meet this goal. The recommended model focuses on a child-oriented result (Child's Well-Being Principle) while remaining mindful of concepts such as the Dual Obligation Principle, the Earner's Priority Principle, and the Disparity of Income Principle. Most importantly, it more closely reflects the child support principles set forth in the governing statute, A.R.S. § 25-320(D).

FINDINGS AND RECOMMENDATIONS OF THE GUIDELINES REVIEW COMMITTEE

For the reasons described more fully below, the Child Support Guidelines Review Committee (GRC) reaffirms the findings of the legislative Child Support Committee's Interim Committee and recommends that Arizona replace its traditional Incomes Shares system with the COBS child support schedule. The GRC believes implementation of the COBS system will mirror the existing system in many ways while resulting in awards that are fairer to both parents and their children, and are more faithful to the policy mandates set out in A.R.S. § 25-320(D), than is the current system.

Reorganization of Guidelines

The GRC reorganized the placement of guideline sections and added content headers to assist users with easy-to-locate information. Reorganization ensures all relevant topic information will be found in the referenced section of the guidelines.

Introducing the “User Guide for Determining Support”

As an addendum to the proposed guidelines, the “User Guide for Determining Support” is a user-friendly tool intended to address the need to simplify the process for the growing ranks of unrepresented litigants, a goal aligned with the Strategic Agenda for Arizona Courts 2005-2010.

COBS Calculator

Dr. Burt Barnow developed the preliminary COBS calculator based upon the GRC's criteria. Since the initial calculator was developed there has been much collaboration between Judge Norman Davis, Tara Ellman, the IT Department of the Administrative Office of the Courts, and GRC members to finalize a product that is user-friendly and appears similar to a current child support calculator that many of the counties currently utilize. The end product will allow the user to generate corresponding court documents such as: the child support worksheet, child support order, judgment and order, and order of wage assignment. The calculator will be accessible on a state-wide basis via the Administrative Office of the Court's website and a stand-alone version will be produced that will allow non-internet connected courts and staff to access.

Specific Changes to Guidelines

The GRC recommends substantial and necessary changes to the Arizona Child Support Guidelines in order to clarify and/or simplify the guidelines. Below are the GRC's proposed changes and reasons for revisions.

Section I. General Information

Background

Because the language relates specifically to the Income Shares Model, the Background section was stricken in its entirety.

Purposes

Section I(A) encompasses the “Purposes” of these guidelines and is only amended to clarify that child support amounts are based on factors outlined in A.R.S. §25-320.

Premises

Section I(B) is reorganized, no substantive changes made.

Presumption

Section I(C) is amended to simplify and to ensure the guidelines continue to comply with current federal law.

Basis of Guidelines

New Section I(D) mirrors the criteria in A.R.S. § 25-320(D) which set out the basis of setting guidelines. Language was added that reflects the guidelines consider parental separation on the parents and their children in order to achieve outcomes that are fair to the child and both parents. A hyperlink reference to the GRC’s Final Report and Recommendations is added for easy reference and for those who seek a detailed description of the methodology used to construct these Guidelines.

Definitions

New Section (E) provides definitions of terminology specific to the Child Outcome Based Support model.

Section II. Determining the Guideline Support Amount

Determining the Guideline Support Amount

Section II has been amended by adding headings for ease of use, and reorganized in a logical fashion.

Income

The language within new Section II(A) clarifies the basic principles for determining the parental income, specifically, that income of a parent's new spouse is not included as income for that parent.

Inclusions to Gross Income of Parties

Section II(B)(1). This section was reworked to clarify when social security benefits will be included for child support calculation, as well as recurring contributions.

Section II(B)(2). Mandatory language ("shall") was stricken and revised to allow the court discretion to assign "in-kind" or other "non-cash benefits" or recurring contributions that reduce living expenses.

Section II(B)(3). When describing self-employment expenses, the GRC replaced the word "necessary" with "reasonable" to clarify the explanation of types of expenses that qualify.

Section II(B)(4). No changes were made to this sub-section.

Section II(B)(5). Further changes include simplifying language regarding reduction in income and circumstances when the court may apply minimum wage. The GRC added "incarceration of a parent" as an example of when it may be inappropriate for the court to attribute income.

Exclusions from Gross Income

Section II(C)(1). No changes were made to this sub-section.

Section II(C)(2). This section was reworded to add clarity regarding excluding income from benefits received by either parent on behalf of a child.

Section II(C)(3). Due to confusion caused by the terminology in the current guidelines, the GRC replaced the word "attribute" with "include" clarifying when income is to be excluded in those instances where a parent is working additional hours through overtime or a second job. The GRC also struck the term "reasonable work regimen" and replaced that language with "an extraordinary work regimen" for clarity.

Adjustments to Income

Section II(D)(1). Comments from stakeholder meetings indicated more instruction was needed to assist the guideline user regarding spousal maintenance payments. The revised

section explains that spousal maintenance shall be added to the gross income of the parent receiving spousal maintenance from any other marriage, if actually paid.

Section II(D)(2). In the current model, a simplified application of the guidelines was applied when adjusting for support of children of other relationships. The simplified application of the guidelines for this adjustment does not translate to the COBS system, so another method was needed to allow for an adjustment for support of other children. The GRC adopted an approach based upon the Wisconsin Percentage of Income Model. In Wisconsin, child support is based upon a percentage of only the paying parent's income and the number of children as follows:

- 17% of gross income for 1 child
- 25% of gross income for 2 children
- 29% of gross income for 3 children
- 31% of gross income for 4 children
- 34% of gross income for 5 or more children

These percentages are pro-rated to form the basis of the percentage adjustment for other children in these guidelines. For example, if you are adjusting for 2 out of 3 children, the adjustment would be two-thirds of 29%. The actual calculations follow.

	2	3	4	5	6	7
1	1 / 2 X .25	1 / 3 X .29	1 / 4 X .31	1 / 5 X .34	1 / 6 X .34	1 / 7 X .34
2		2 / 3 X .29	2 / 4 X .31	2 / 5 X .34	2 / 6 X .34	2 / 7 X .34
3			3 / 4 X .31	3 / 5 X .34	3 / 6 X .34	3 / 7 X .34
4				4 / 5 X .34	4 / 6 X .34	4 / 7 X .34
5					5 / 6 X .34	5 / 7 X .34
6						6 / 7 X .34

Other Children	Total number of children the parent is legally obligated to support (includes children being supported by court order)					
	2	3	4	5	6	7
1	12.5%	9.67%	7.75%	6.80%	5.67%	4.86%
2		19.33%	15.50%	13.60%	11.33%	9.71%
3			23.25%	20.40%	17.00%	14.57%
4				27.20%	22.67%	19.43%
5					28.33%	24.29%
6						29.14%

This result was rounded to create the adopted table found in the proposed Guidelines.

Adjusted Gross Income

Section II(E). Explanation of the Adjusted Gross Income is further clarified.

Adjusting Support Amounts to Reflect the Parenting Time Allocation

Section II(F). In response to public comments and recommendations from the Case File Review, the GRC recommends eliminating the Parenting Time Tables altogether. Application of the Parenting Time Table B has been virtually nonexistent in the last two case file reviews which lead the GRC to believe its relevance is misleading and causes confusion when utilizing it. Instead, the committee recommends taking into account both the variable and duplicated costs each parent incurs on account of the children, which depend in part on each parent's share of the parenting time. Section II(F)(1) is added to clarify general provisions regarding how parenting time is calculated. Section II(F)(2) gives a general explanation of what variable and duplicated costs are and a detailed example. Section II(F)(3) details how to measure parenting time, along with several examples. The revised method for calculating support now includes circumstances wherein there is equal parenting time. This eliminated the need for Section 12 of the existing guidelines.

Preliminary Support Amount

Section II(G). The Basic Child Support Obligation terminology from the current model was eliminated and replaced with the Preliminary Support Amount language in order to merge the concept into the COBS method. This new section explains that the Preliminary Support Amount is an intermediate step in the child support calculation and is determined by using the parents' Adjusted Gross Income, the number of children subject to the support order, and adjusting for parenting days. The section also clarifies that the parent who would pay the Preliminary Support Amount is the Preliminary Obligor, usually the noncustodial parent. However, the custodial parent may be the Preliminary Obligor in the less common case in which the custodial parent's income is much larger than the noncustodial parent's, and the noncustodial parent has a substantial number of parenting days.

When a Parent's Income is More than \$20,000 Monthly

Section II(H). Many public comments were submitted to the GRC during the public comment period indicating that the combined gross income of \$20,000 should be extended to accommodate more high-income earners. The updated review consultant recommended that the committee consider extending the schedule to higher incomes, adopt a formula for incomes above the schedule, or eliminate the criterion that the obligee bears the burden of proof that a higher amount is appropriate. The GRC recommends extending the schedule to \$20,000 gross monthly income for each individual, rather than \$20,000 combined income of the parents. This change is expected to reduce the number of deviations in the next review.

This section gives great latitude for the court to reduce or increase the child support order when parent's incomes exceed \$20,000 a month, after the court considers the factors in A.R.S. § 25-320(D) that a higher or lower amount is appropriate.

More than Four Children

Section II(I). 87% of the 2007 review cases covered one or two children and less than 3% have four or more children. The 2002 sample results indicated less than 2% have four or more children. This data supported the GRC's decision to develop the COBS calculator to give support amounts for up to four children. When five or more children are the subject of the support order, the court may consider the factors in A.R.S. § 25-320(D) to increase the support order if it finds the higher amount is appropriate.

Adjustments to Support

Section II(J). This section is amended by adding instructive language that the child-related expense adjustments shall generally be shared by the parents in proportion to their Adjusted Gross Incomes.

Childcare Costs

Section II(J)(1). This section was greatly simplified by instructing the guideline user that the court may adjust the Preliminary Support Amount for childcare costs appropriate to the parents' financial abilities.

Education Expenses

Section II(J)(2). The GRC retained the courts' discretion to adjust the Preliminary Support Amount; specifically that "necessary expenses appropriate to the parents' financial abilities for attending private or special schools or necessary expenses to meet particular education needs of a child when such expenses are incurred by agreement of both parents, or ordered by the court."

Extraordinary Child

Section II(J)(3). As in Section II(J)(1) and (2), the court retains discretion to adjust the Preliminary Support Amount appropriate to the parents' financial abilities for special needs of gifted or handicapped children. Due to comments received from stakeholders, additional language was added to address and clarify that extracurricular and school activity expenses are not considered extraordinary expenses.

Medical Support

Section II(J)(4). Due to changes in state law since the last review, this section received a major overhaul. Language was added that reiterates current state law, namely, orders for child support assign responsibility for providing medical insurance or cash medical support for the children subject of the child support order, and that cash medical support must be established if the court finds that neither parent can obtain medical insurance that is accessible and available at a reasonable cost. The new language further instructs the guideline user not to include any amounts paid for cash medical support (pursuant to A.R.S. § 25-320(K) or (L)) to the Preliminary Support Amount.

Applying Adjustments

New Section II(J)(5) instructs the user how to adjust for court-approved costs of childcare, educational expenses, extraordinary expenses and health insurance. The user is informed that the resulting amount is now the Guidelines Support Amount, unless further

adjustments under Section II(K) apply. Section II(K) applies only in those cases, when, after adjustments in II(J) the custodial parent would be the Guideline Support Obligor. A detailed example was included to instruct the user how to calculate allocation of these expenses. Note: The “over twelve” adjustment contained in the existing guidelines is no longer applicable under the proposed model and is therefore, stricken because the calculation is no longer based upon estimates of marginal expenditures in intact families.

When the Custodial Parent Would be the Guideline Support Obligor

Section II(K). Implementation of the COBS method requires defining terminology that is unique to COBS. This section defines the Guideline Support Amount, Obligor and Guideline Support Oblige. Additionally, this section explains the Guideline Support Amount is the amount of child support that the court will order unless either:

- a. The court orders a lower amount due to the Self Support Reserve Test, or
- b. There is a finding that a deviation from the guidelines is appropriate.

Self Support Reserve

Section II(L) is amended to conform terminology to the COBS method and to outline the purpose of the Self Support Reserve. The GRC recommends updating the minimum subsistence level from \$775 to \$903 per month, which is the current poverty level for a single person at 100% of gross monthly income.

Final Support Order

Section II(M). This new section defines a “Final Support Order” to conform terminology to the COBS method.

Rounding the Guideline Support Amount

Section II(N). Federal regulation encourages states to limit guidelines deviations and use the findings from the case file review to recommend guidelines changes that will reduce the numbers of guidelines deviations. Dr. Venohr opined in the Basis of an Updated Child Support Schedule for Arizona that the deviation rate would decrease from 26% to 21% if the round-off cases were not considered deviated amounts. Based upon this recommendation the GRC explains that rounding off, or entry of a zero order when the guidelines amount is insignificant, should not be defined as a deviation. It is expected that this standardized procedure will reduce the percentage of deviations from the applications of the guidelines during the next case file review. In an effort to achieve consistency with future case file reviews, to reduce the number of “deviations” that are attributed to the state, and to provide guidance to the court and staff, this section was added to instruct when and how to round Guideline Support Amounts.

III. Guideline Support Order

Court's Findings

Section III(A) This section was amended to match the COBS method language to the reorganized guidelines. The GRC also added language to clarify the start date for child support orders shall be the first day of a month. Directing child support orders to begin at the start of a month will provide consistent orders, eliminate confusion by providing clear expectation amongst parties, and is expected to reduce the impact of unclear court orders when parties or court staff is required to provide child support arrears calculations.

Exchange of Information

Section III(B). No wording or substantive changes are recommended.

Gifts in Lieu of Money

Section III(C). No wording or substantive changes are recommended.

Dependency Exemption

Section III(D). Several improvements were made to the dependency exemption section. Mandatory language was added to this section to reflect that an allocation of the federal tax exemptions shall occur in any case in which the current child support obligation is at least \$1,200 per year. Language was added to further transparency regarding the method by which parents allocate claiming dependency exemptions for their children.

The GRC also added language to explain that in order for the Support Obligor to be considered current on all child support and arrears payments, the child support and arrearage payments due by December 31 of that tax year must be received by the Clearinghouse by January 15 of the next tax year. If the Support Obligor is current on all the court-ordered child support obligations, the other parent shall execute the necessary IRS documents to allow the paying parent to claim the exemption. If the Support Obligor has failed to make these payments, the other parent shall be entitled to the tax deduction for that year.

To address confusion that has existed regarding the impact of non-payment of medical reimbursement on entitlement to the dependency exemption, the GRC clarified that any unpaid contributions to medical expenses or extra-curricular expenses, do not affect the entitlement to the deduction unless reduced to a judgment and due by a date certain during that tax year.

Unreimbursed Medical Expenses

Section III(E). Information regarding unreimbursed medical expenses was previously addressed in Section 9 - Determining the Total Child Support Obligation. The GRC separated this issue under a new header in the Guideline Support Order Section, as new legislation was passed in 2008 that addresses cash medical support orders. Due to this legislation, the GRC added language that specifies that the court will allocate the

percentage that each parent pays, in excess of cash medical support, for any medical, dental or vision costs of the children that are not covered by insurance.

Travel Expenses

Section II(F). This section is amended to expand when the court may divide travel expenses by including not only one-way travel that exceeds 100 miles, but also “extraordinary circumstances.” The court will consider the financial resources of the parents and may consider how their conduct, such as a change of residence, has affected the costs. Further, the court may:

1. Order one parent to reimburse the other parent, or
2. Assign to one parent all of the travel expenses and alter the child support to reflect the fact that the parent is paying all of the travel expenses.

IV. Special Circumstances

Deviation

The GRC reorganized this section and added Section IV(A)(3).

By Court

Section IV(A)(1). This section was amended by removing the mandatory language and allowing the court discretion regarding ordering support which is a deviation from the guidelines.

By Agreement

Section IV(A)(2). The GRC added a heading entitled “By Agreement” to the provision that speaks to an agreed upon amount of support that is a deviation from the guidelines, and includes the reference to Rule 69, *ARFLP*.

Examples for Deviation

Section IV(A)(3). This new Section illustrates circumstances that may justify a deviation. The GRC believes further instruction regarding appropriateness of deviation from the application of the guidelines is necessary to clarify areas of concern such as: extraordinary income tax circumstances, when there are more than four children who are subject of this court order, and when one or both of the parents’ incomes exceed \$20,000 per month.

Multiple Children, Divided Physical Custody

Section IV(B). The GRC clarified the explanation regarding how the appropriate calculation should be made in these parenting time arrangements. No substantive changes were made.

Multiple Children, Varying Parenting Time Schedule

Section IV(C). Several public comments requested further instruction in the guidelines regarding the appropriate calculation of parenting time when parents have different parenting time schedules with multiple children. Because the determination of parenting time is not as precise as when the children are under the same schedule, the GRC recommends performing two separate calculations. The first calculation should be based upon the assumption that all of the children are under the lesser parenting time schedule. The second calculation should be based upon the assumption that all of the children are under the greater parenting time schedule. The two resulting child support amounts shall represent the range of support obligation between the two parenting time schedules. The child support award may be any amount that falls within the range of the two calculated figures and is not considered a deviation.

Third Party Caregivers

Section IV(D). The recommended change to Section IV(D) allows the court discretion to order parents to pay a third party caregiver child support payments on behalf of the child.

This section is relocated under the heading of “Special Circumstances” to make it easier to locate within the guidelines.

Support Assigned to State

Section IV(E). In addition to child support, this sub-section is amended to include cash medical support orders and to clarify that cash medical support orders that have been assigned to the state (IV-D cases) may not be waived or forgiven by the custodial parent.

Income and Benefits – Income of a Child

Section IV(F)(1). The GRC added “court-ordered” child support language to this section to clarify that these monies shall not be counted toward either parent’s child support obligation.

Benefits Received on Behalf of a Child

Section IV(F)(2). Identifying header was added to this section. No other substantive changes were made.

Benefits Not Included in Parent’s Income

Section IV(F)(3). This new sub-section is merely reorganization of the guidelines and is comprised of language moved from the previous guidelines section 26(C). No substantive changes were made.

Disabled Adult Child

Section IV(F)(4). This new sub-section outlines when the court may order support to continue past the age of majority for a disabled child pursuant to A.R.S. § 25-320(E) and A.R.S. § 25-809(F). The GRC also inserted a warning to guideline users that depending upon the nature of the court order, the benefits received by the disabled adult child may be reduced.

Arrears

Section IV(G)(1) is amended by clarifying the court will balance all relevant considerations when setting an amount for a payment on arrears, and will not set the payment at an amount less than the accruing monthly interest unless there are compelling circumstances justifying a lower payment, with findings as to why the amount is justified.

Section IV(G)(2). New language in this sub-section clarifies that the court shall consider the amount of the monthly child support obligation at the time that a current child support obligation terminations as evidence of the amount the obligor has the ability to pay monthly towards arrears.

Section IV(G)(3). This new sub-section instructs that the court may modify the payment on arrears upon a showing of substantial and continuing changed circumstances.

Section IV(G)(4). This new sub-section addresses the importance for the Support Obligor to be able to sustain him or herself when the court sets or modifies the arrears payment. The court shall consider whether the obligor’s available income after payment of all

current child support obligations and payments on arrears meets the Self Support Reserve test.

V. Modification and Termination of Support

Duration and Termination of Child Support

Section V(A) is amended to include statutory reference detailing the laws regarding emancipation. The GRC was informed by way of public comments that some employers are not honoring the presumptive termination date for the purpose of terminating Orders of Wage Assignment and the statewide process is inconsistent. Obligors are mistakenly relying upon the presumptive termination date rather than affirmatively seeking to stop the Order of Assignment. This specific issue is outside the scope of the GRC for this review; however, it is the recommendation of this committee that this issue be more closely examined by the legislative Child Support Committee for possible changes to statute.

In order to more adequately address this issue, special formatting (bolding and caps) was added to language that informs the guidelines user that the wage assignment may not stop automatically and in that event, a motion to stop the wage assignment may be necessary.

Effect of Emancipation

Section V(B). This new sub-section outlines for the guideline reader that the amount of child support does not automatically change if one of the children emancipates, and instructs the reader that a request, petition, or agreement must be made in writing to the court in order to recalculation the child support obligation.

Modification

Section V(C). This section identifies the process for modification by categorizing modifications by Standard Procedure, Simplified Procedure, or By Agreement.

Standard Procedure

Section V(C)(1). There are no substantive changes made to the Standard Procedure sub-section.

Simplified Procedure

Section V(C)(2). The Simplified Procedure sub-section has undergone substantial changes, mostly addressing the types of documentation the parties are to provide, as well as removing the Simplified Procedure option to self-employed parties absent the agreement of both parties. Additionally, there is an added provision that allows a responding party to oppose the simplified procedure and request that the action proceed under the standard procedure for modification. This is important to ensure that discovery may be conducted.

By Agreement

Section V(C)(3). This sub-section was added to offer instructions to the guidelines user when the parties agree to modify a child support order.

Phase-In Support Orders

Sections V(D) - The GRC is cognizant of the fact that in certain circumstances, a significant increase in the child support award may occur. This increase is based upon the inadequacy of child support in cases in where there was a great disparity in earnings between the parents. This became exacerbated as parenting time increased toward an equal allocation. The GRC noted, however, that immediate implementation of increased amounts could create a financial hardship for the paying parent. Therefore, in an effort to balance the need for adequate support awards against its impact upon the payor, a phased-in method is included in these Guidelines.

APPENDIX A:

Administrative Order Establishing The Guidelines Review Committee

IN THE SUPREME COURT OF THE STATE OF ARIZONA

In the Matter of:)	
)	
ESTABLISHMENT OF THE)	Administrative Order
COMMITTEE FOR THE)	<u>No. 2008 - 22</u>
QUADRENNIAL REVIEW OF)	
THE CHILD SUPPORT GUIDELINES)	
<hr/>		

Pursuant to the Arizona Revised Statutes § 25-320 (D), the Supreme Court shall establish guidelines for determining the amount of child support and review the guidelines at least once every four years to ensure that their application results in the determination of appropriate child support amounts.

In accordance with Arizona Code of Judicial Administration § 1-104, the Chief Justice may establish advisory committees to the Arizona Judicial Council to assist the council in carrying out its responsibilities. Therefore, pursuant to Article VI, Section 3, of the Arizona Constitution,

IT IS ORDERED that the Child Support Guidelines Review Committee is established to review the current statewide child support guidelines and make recommendations as provided below:

1. Limited Purpose.

PHASE I:

The Committee shall review updated information regarding economic data on the cost of raising children, and conduct case file review and analysis to determine if adjustments to the current child support schedule are needed. The Committee shall then report its recommendations for changes to clarify and/or simplify the guidelines.

PHASE II:

Contingent upon available funding as determined by the Administrative Director, the Committee shall investigate and report its findings and recommendations on the advantages and disadvantages of implementing a forward-looking method of calculating child support and its potential impact on the courts. Issues to be considered may include costs of implementation, training, and programming changes or costs associated with the development of a child support calculator.

2. Membership and Term.

The individuals listed on Appendix A are appointed as members of the Child Support Guidelines Review Committee beginning upon entry of this Order. The terms of the committee and

the members shall expire at the conclusion of the project, scheduled for June 2009.

3. Meetings.

Committee meetings shall be scheduled at the discretion of the Committee Chair. Pursuant to Arizona Code of Judicial Administration § 1-202, all meetings shall comply with the public meeting policy of the Arizona Judicial Branch.

4. Administrative Support.

The Administrative Office of the Courts shall provide staff for the Committee who may conduct or coordinate research as requested by the Committee.

5. Reports.

The Committee shall prepare a preliminary report regarding its work under Phase I to the Child Support Committee, the Committee on Superior Court, and the Arizona Judicial Council on or before October 23, 2008. The Committee shall submit a final report to the Arizona Judicial Council at the June, 2009 meeting.

Dated this 26th day of February, 2008.

RUTH V. MCGREGOR
Chief Justice

Administrative Order Extending The Guidelines Review Committee

IN THE SUPREME COURT OF THE STATE OF ARIZONA

In the Matter of:)	
)	
EXTENSION OF THE COMMITTEE)	Administrative Order
FOR THE QUADRENNIAL REVIEW)	<u>No. 2009 - 46</u>
OF THE CHILD SUPPORT)	(Amending Administrative
GUIDELINES)	Order No. 2008-22)
)	

On February 26, 2008, Administrative Order No. 2008-22 established the Committee for the Quadrennial Review of the Child Support Guidelines. Pursuant to that Order, the term of the Committee was scheduled to expire in June 2009. However, the Committee has asked for additional time to solicit comments on its proposals from the court community and Arizona State Bar members in order to provide a fully-vetted report and recommendations to the Supreme Court. Therefore, after due consideration,

IT IS ORDERED that the Committee for the Quadrennial Review of the Child Support Guidelines is extended to December 31, 2009. The Committee shall submit its final report and recommendations to the Arizona Judicial Council at the Council's October 2009 meeting.

Dated this 6th day of May, 2009.

Section I: Introduction

PURPOSE OF REPORT

Child support contributes to the financial well-being of many Arizona children. In 2007, the Census reported that there are 1,670,555 children living in Arizona and 541,963 of those children live with only one parent.¹ This amounts to one out of three children living with only one parent. Most of these children are eligible for child support. An unknown number of Arizona children living in other situations are also eligible for child support. One of their parents may have remarried and they now live with a step-parent or they live with foster parents or in other situations without both of their parents. The Arizona Department of Economic Security, Division of Child Support Enforcement (DCSE) collects over \$300 million in child support annually for many of these children. An unknown amount of additional support is paid to non-DCSE cases.

In Arizona, child support orders are set using the child support guidelines (Arizona Supreme Court Administrative Order No. 2004-29). The core of the guidelines calculation is a lookup schedule of basic obligations for a range of incomes and number of children. The basic obligations reflect economic data on the costs of raising children. The obligated parent's pro rata share of the basic obligation forms the basis of the award amount. To determine the final obligation amount, the guidelines provide for additional adjustments such as parenting time, health insurance, child care expenses, and other factors.

The existing Arizona guidelines schedule is based on economic data available in 2002. This report develops and documents an updated Arizona child support schedule using the most current economic data available and the same assumptions underlying the existing schedule. It is being developed as part of the 2008-09 Arizona child support guidelines review. State statute and federal regulation require a periodic review of the guidelines.² As part of the federal requirement, states must consider economic data on the cost of raising children.

The Arizona Administrative Office of the Court (AOC) contracted with Center for Policy Research (CPR) to prepare the updated schedule. The schedule will be reviewed by the Child Support Guidelines Review Committee, whom the Court has charged with developing recommendations for changes to clarify and simplify the guidelines. The AOC provides more information about the Committee's deliberations and considerations at its website:

<http://www.supreme.state.az.us/csgrc/> Arizona is also considering other guidelines models, the principles of those models, and other information. This report does not address these other considerations. This report also does not consider other factors in the order calculation that are outside the schedule such as the timesharing adjustment and the self support reserve. These issues are outside the scope of CPR's contracted assistance. Nonetheless, to help the Committee address its concern about the guidelines amounts in cases involving a low-income obligee and higher income obligor, CPR provides an example and pinpoints the problem to the existing parenting-time adjustment.

¹ U.S. Census American Community Survey (2007). Downloaded from <http://factfinder.census.gov> on November 25, 2008.

² Arizona Revised Statutes § 25-320(D) and Title 45, Public Welfare, CFR §302.56.

ORGANIZATION OF REPORT

The report is organized into four sections.

- Section I provides an introduction. This includes the purpose of the report, a summary of federal regulations pertaining to state child support guidelines, and an overview of the Arizona child support guidelines relative to other state guidelines.
- Section II reviews estimates of child-rearing expenditures. It reviews those underlying state child support guidelines.
- Section III contains the updated schedule. The 2008 updated schedule is in Exhibit 8. This section also outlines the data and steps used to develop the updated schedule.
- Section IV compares the amounts under the new and updated schedule. It also summarizes the changes in the economic factors underlying the schedule. In addition, it documents the underlying basis of the Arizona timesharing adjustment and how it contributes to inadequate order amounts.

Side-by-side comparisons of the new and updated schedule are provided in Appendix A.

FEDERAL REQUIREMENTS

Federal law has required state advisory child support guidelines since 1987.³ The Family Support Act of 1988 expanded the requirement. As of 1989, each state must have one guideline that is to be applied presumptively rather than on an advisory basis.⁴ It also requires each state to establish deviation criteria that allow for the rebuttal of the state's presumptive guideline. The state-determined criteria must take into consideration the best interests of the child.

Federal regulation requires states to review their child support guidelines at least once every four years [45 CFR §302.56]. As part of that review, states must consider economic data on the costs of raising children and examine case file data to analyze the application and deviation from the guideline. Another report by CPR summarizes the findings from the analysis of case file data including the guidelines deviation rate.⁵

GUIDELINES MODELS

States have discretion in the guidelines models that they use. Yet, according to federal requirements, they must:

- Be based on specific descriptive and numeric criteria;
- Take all earnings and income of the noncustodial parent into consideration; and
- Provide for the child(ren)'s health care needs.

³Advisory statewide guidelines were required as part of Child Support Enforcement Amendments of 1984 [P.L. No. 98-378].

⁴Presumptive guidelines were required as part of the Family Support Act of 1988 [P.L. No. 100-485].

⁵ Venohr and Kaunelis (2008), *Arizona Child Support Guidelines Review: Analysis of Case File Data*. The report is available at the Court's website:
<http://www.supreme.state.az.us/csgrc/14.%20AZ%202008%20case%20file%20review%20revised%2012-02-08.pdf>

Most states, including Arizona, base their guidelines on the Income Shares Model, which was developed through the 1984-87 National Child Support Guidelines Project.⁶ Convened by the federal Office of Child Support Enforcement at the request of Congress, the Project made recommendations for the development of state guidelines. Prior to the 1987 requirement, few states had statewide guidelines. Further, many early guidelines reflected welfare cash benefits rather than what middle and higher income families spend on child rearing.

Income Shares Model

The Income Shares model was developed to embody the principles of state child support guidelines identified by the Guidelines Project's Advisory Panel. (Those principles are shown in Exhibit 1.) It also incorporates economic data on actual child-rearing expenditures. The Income Shares guidelines model is based on the premise that the child should be entitled to the same level of expenditures that the child would have received had the parents lived together and combined financial resources. As a consequence, the core of the Income Shares model is a measurement of how much families spend on child rearing. In turn, that amount is often adjusted in a guidelines worksheet for different situations such as parent-ing-time arrangements, children from other relationships, and other factors.

Exhibit 1: Summary of the State Guidelines Principles Identified by 1984-87 Child Support Guidelines Project Advisory Panel	
1.	Both parents should share in the financial support of their children. The responsibility should be divided in proportion to their available income.
2.	The subsistence needs of each parent should be considered, but in virtually no case should the obligation be set at zero.
3.	Child support must cover a child's basic needs as a first priority; but, to the extent either parent enjoys a higher standard of living, the child is also entitled to share in that higher standard of living.
4.	Each child of a given parent has a right to a share of that parent's income. (In other words, when a parent has other children besides the children for whom support is being determined, an adjustment may be appropriate.)
5.	The guidelines should not treat children of separated, divorced, and never-married parents differently.
6.	The guidelines should not assume whether the mother or father is the custodial parent.
7.	The guidelines should not create economic disincentives to remarry or work. (An economic disincentive to remarry could exist if the guidelines considered a new spouse's income. An economic disincentive to work can be maintained by imputing income to a parent who is voluntarily unemployed or underemployed.)
8.	The guidelines should consider the involvement of both parents in the child's upbringing. It should take into consideration the financial support provided by parents in shared physical custody or extended visitation arrangements. Yet, this does not necessarily obviate the child support obligation in 50/50% timesharing arrangements.

The premise of the Incomes Shares model applies to children of previously married parents as well as never-married parents. Children should not be forced to live in poverty because of their parents' decisions to separate, divorce or not marry. Children of disrupted families, regardless of the reason for the disruption, should be afforded the same financial opportunities as children of intact families with similar incomes.

⁶ National Center for State Courts (1987). *Development of Guidelines for Child Support Orders, Final Report*. Report to U.S. Department of Health and Human Services, Office of Child Support Enforcement, Williamsburg, Virginia.

Another major premise of the Income Shares model is that both parents are financially responsible for their children. To this end, the average amount expended on children is prorated between the parents. The obligated parent's share becomes the basis of the child support award. There may be other adjustments for physical custody or other factors.

Other Guidelines Models

Melson Formula. Judge Melson of Delaware developed the Melson formula. It first considers the basic needs of the children and each parent. If the obligated parent's income is more than sufficient to cover his or her share of the basic needs of the children and his or her basic needs, an additional percentage of that parent's remaining income is assigned to child support.

Percentage-of-Obligor Model. The percentage-of-obligor income guidelines model is the simplest and oldest guidelines model. It assigns a flat or sliding-scale percentage of obligor income to support. It does not consider the obligee's income in the calculation.

Guidelines Models Not in Use. In recent years, various groups have introduced a few new guidelines models (i.e., The Children's Right Council first introduced a version of the Cost Shares model, the American Law Institute introduced its guidelines concept); yet, no state has adopted them.⁷

State Usage of Guidelines Models

As shown in Exhibit 2, there are 38 states that currently rely on the Income Shares model; 10 states that use a percentage-of-obligor income guidelines model; and, three states that rely on the Melson formula.

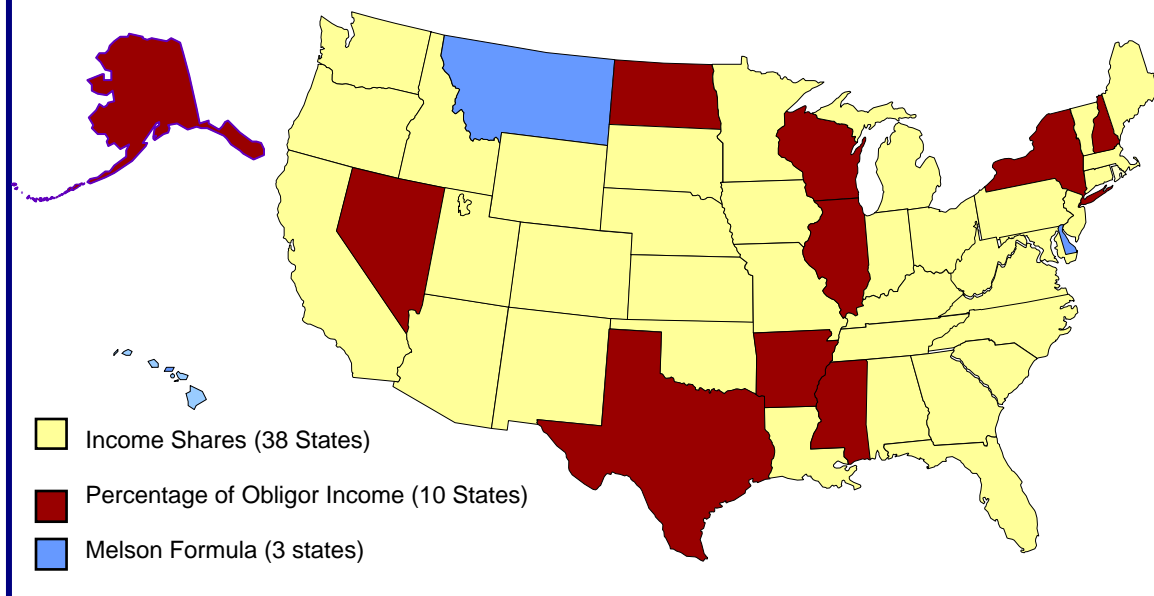

Until recently, few states have changed guidelines models. However, beginning in 2005, several states adopted Income Shares. Tennessee, Georgia and Minnesota moved from the percentage-of-obligor model to Income Shares guidelines. The District of Columbia and Massachusetts also recently switched to an Income-Shares approach: the District switched in April 2007 and Massachusetts switched in January 2009. Prior to the change, the District and Massachusetts relied on a similar guidelines formula. It considered only the obligor's income until the custodial parent's income exceeded a particular threshold (\$20,000 per year net child care expenses in Massachusetts); then, once that threshold was exceeded, the obligation was reduced by a percentage of the custodial parent's income.

Basis of Arizona's Guidelines

Arizona has based its guidelines on the Income Shares model since the late 1980s. Its first version relied on a prototype Income Shares model developed through the National Child Support Guidelines project. Subsequently, Arizona has updated its schedule several times for new economic data, as well as considered other guidelines models.

⁷ For more information on these guidelines models, see the 1999 Child Support Symposium published by *Family Law Quarterly* (Spring 1999) and Beld and Biernat (2003).

Exhibit 2
State Usage of Child Support Guidelines Models

Section II: Estimates of Child-Rearing Expenditures and Expenditures Data

The purpose of this section is to describe the estimates of child-rearing expenditures. The estimates are first summarized. This is followed by a discussion of the data source used to produce the various estimates. Finally, this section concludes with a discussion of the usage of these estimates in state guidelines.

ESTIMATES OF CHILD-REARING EXPENDITURES

Most state child support guidelines based on economic data rely on one of the following studies on the costs of raising children:

- Jacques van der Gaag (1981). *On Measuring the Cost of Children*. Discussion Paper 663-81. University of Wisconsin Institute for Research on Poverty, Madison, Wisconsin.
- Thomas J. Espenshade (1984), *Investing in Children: New Estimates of Parental Expenditures*, Urban Institute Press: Washington, D.C. (1984).
- David M. Betson (1990), *Alternative Estimates of the Cost of Children from the 1980-86 Consumer Expenditure Survey*, Report to U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation, University of Wisconsin Institute for Research on Poverty, Madison, Wisconsin (1990).
- David M. Betson, (2008) "Chapter 5: Parental Expenditures on Children," in Judicial Council of California, *Review of Statewide Uniform Child Support Guidelines*, San Francisco, California (2001). Available at URL: <http://www.courtinfo.ca.gov/programs/cfcc/1058files2001/CH5.PDF>
- David M. Betson (2006). "Appendix I: New Estimates of Child-Rearing Costs in PSI, *State of Oregon Child Support Guidelines Review: Updated Obligation Scales and Other Considerations*, Report to State of Oregon, Policy Studies Inc., Denver Colorado. Available at URL: http://www.dcs.state.or.us/oregon_admin_rules/psi_guidelines_review_2007.pdf
- Mark Lino (2008), *Expenditures on Children by Families: 2007 Annual Report*, U.S. Department of Agriculture, Center for Nutrition and Policy Promotion. Miscellaneous Publication No. 1528-2007. Available at URL: <http://www.cnpp.usda.gov/ExpendituresonChildrenbyFamilies.htm>

The studies rely on various methodologies to estimate the costs of raising children and different data years.

Overview of Methodologies

Most of the above studies measure average child-rearing expenditures.⁸ They typically are measured from examining expenditures data from several thousand families participating in the Consumer Expenditures Survey (CES), the nation's largest and most comprehensive survey of household expenditures.⁹

Not all economists arrive at the same estimate of child-rearing expenditures. Moreover, economists do not agree on which estimate best reflects actual child-rearing expenditures. Part of the problem is that there is no perfect methodology for separating the children's share of family expenditures from the parents' share. To illustrate this, consider family expenditures for electricity used in the home. The children's share of electricity is not obviously separable from the parents' share by examining the electricity bill.

The most common methodology for separating child and adult expenditures is a marginal cost approach, which compares expenditures between two equally well-off families: (a) married couples with children, and (b) married couples of child-rearing age without children. The difference in expenditures between these two families is deemed to be child-rearing expenditures. The Engel and Rothbarth methodologies, named by the economists who developed them, are both forms of the marginal cost approach. The Engel methodology uses expenditures on food, while the Rothbarth methodology relies on expenditures for adult goods (specifically, adult clothes in the Rothbarth estimates that form the basis of state guidelines) to determine equally well-off families. Most economists believe that the Engel estimator overstates actual child-rearing expenditures and the Rothbarth estimator understates actual child-rearing expenditures.

van der Gaag (1981) Estimates

In his study, van der Gaag concluded that a couple that adds one child to the household needs 25 percent more gross income in order to maintain the standard of living they enjoyed when they had no children. Wisconsin used van der Gaag's estimates to develop its child support table, although adjusted this percentage to account for taxes and other factors. Since then, several states adopted Wisconsin's flat percentage of obligor gross income as their guidelines formula.

Espenshade (1984) Estimates

Most states, including Arizona, relied on Espenshade's measurements when they first developed child support guidelines in the 1980s because his was the most authoritative study available at the time. It formed the basis of the prototype Income Shares model developed through the 1984-87 National Child Support Guidelines Project.¹⁰ Using the Engel method-

⁸ An alternative measurement may be the "costs" of child rearing. Cost studies often measure or reflect the costs of the child's basic needs, such as the federal poverty level. However, measurements of child-rearing expenditures that range in family size and income are more helpful for forming state guidelines since most states premise their guidelines on the precept that child support should not be limited to amounts that cover the child's basic needs; rather, the child should share in the standard of living that can be afforded by the parent(s).

⁹ The CES is conducted by the Bureau of Labor Statistics (BLS). More information about the CES can be found at the BLS website: <http://www.bls.gov/cex/>. In addition, CES information that is relevant to child support is discussed later in this section.

¹⁰ National Center for State Courts (1987).

ology, Espenshade found that families spend about \$58,000 to \$138,000 (in 1981 dollars, hence over twice as much in 2008 dollars) to raise a child from birth to age 18 years.

Betson's Three Studies

In the past 18 years, Betson has conducted three studies estimating child-rearing expenditures. Each study uses more recent data.

Betson (1990) Estimates. Betson applied five different methodologies to estimate child-rearing expenditures using 1980-86 CES data.¹¹ This study was conducted for the U.S. Department of Health and Human Services to fulfill a Congressional requirement to provide information useful for the development and review of state guidelines. He concluded that estimates using the Rothbarth methodology were the most robust, and hence recommended their use for state guidelines. He rejected his estimates using the Engel methodology, which was used by Espenshade, because they approached implausibly high levels. Betson's application of the Rothbarth estimator finds that the average percentages of total household expenditures devoted to children in intact families are: (a) 24 percent for one child, (b) 34 percent for two children, and (c) 39 percent for three children. Betson's application of the Engel estimator finds that the average percentages of total expenditures devoted to children in intact families are: (a) 33 percent for one child, (b) 39 percent for two children, and (c) 49 percent for three children.

Betson (2001) Estimates. In 2001, Betson updated his 1990 estimates based on the Rothbarth and Engel methodologies using more recent data (1996-98, initially, but later expanded it to include 1996-99). This study was conducted through the States of Michigan and California and the University of Wisconsin Institute for Research on Poverty. The only difference between the 2001 and earlier estimates was in the years the data were gathered. The source of data (CES), the estimation methodologies, and the assumptions Betson used to develop the estimates did not change. These estimates form the basis of many state child support guidelines including the current Arizona schedule. Using the more current data, Betson's application of the Rothbarth estimator found that the average percentages of total household expenditures devoted to children in intact families are: (a) 26 percent for one child, (b) 36 percent for two children; and (c) 42 percent for three children. Betson's application of the Engel estimator found that the average percentages of total expenditures devoted to children in intact families are: (a) 32 percent for one child, (b) 46 percent for two children, and (c) 58 percent for three children.

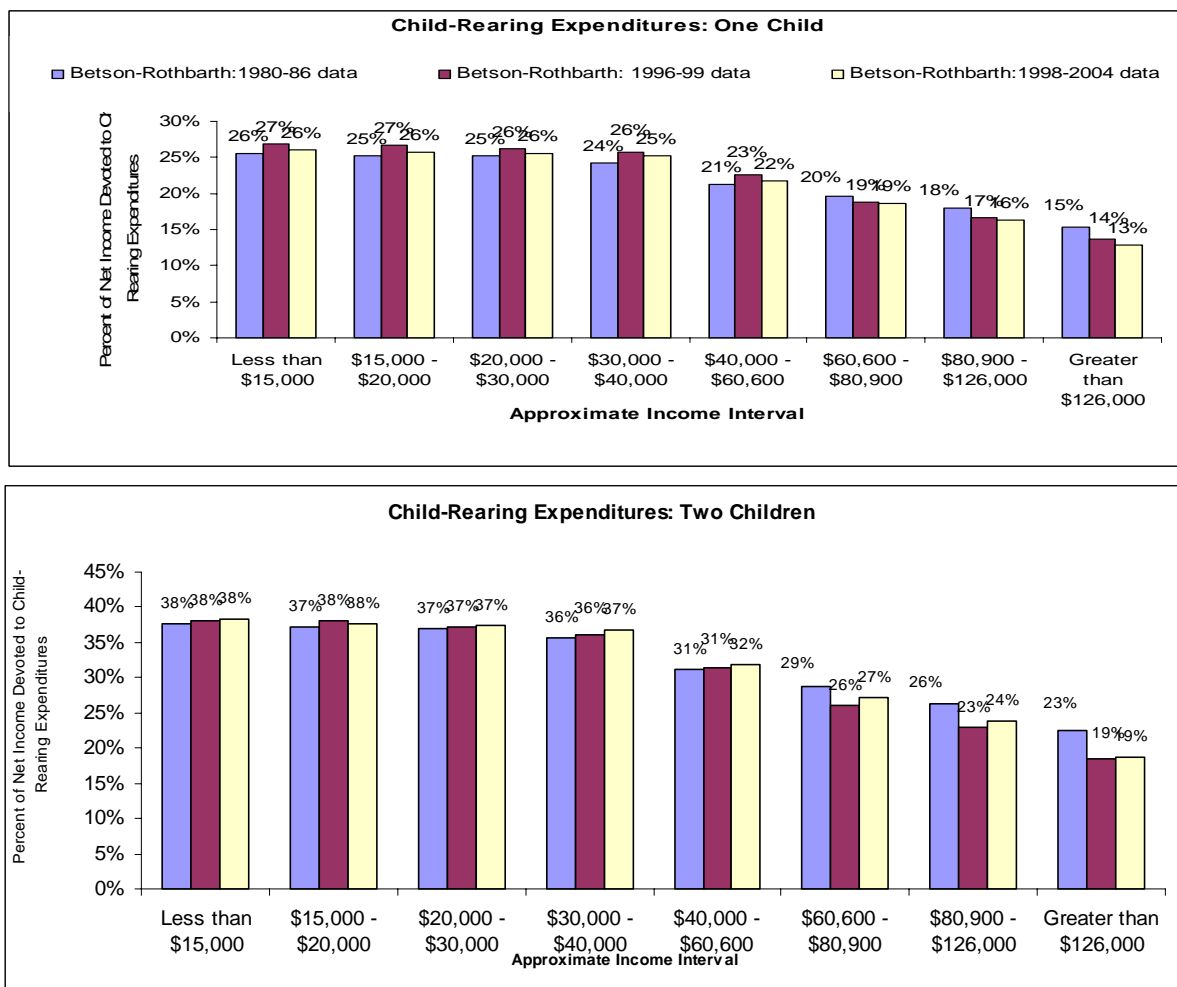

Betson (2006) Estimates. In 2006, Betson updated his 2001 estimates using the Rothbarth methodology with data from 1998 through the first quarter of 2004 for the state of Oregon. The 2004 survey was the most recent data available from the CES at that time. Betson did not update the estimates using the Engel methodology or other approaches. The Oregon table at the time was based on the Betson-Rothbarth estimates relying on survey data collected in 1996-99 and Oregon only wanted to use updated survey data. (A more complete discussion of Betson's findings using the updated data is available in the 2006 Oregon guidelines review report.)

¹¹ The five approaches were (1) Engel, (2) Rothbarth, (3) ISO-PROP, (4) Barten-Gorman, and (5) per capita (i.e., average cost approach, similar to the USDA approach).

For this set of estimates, Betson relied on data from a wide range of years for two reasons. First, it increased the sample size, hence the reliability of the estimate. Secondly, it spanned several economic cycles: the high growth of the late 1990s; the short recession in 2002; and the stable economic growth afterwards. Similar to the 2001 update, he applied the same assumptions and method, but he used more recent data. His findings showed that the child-rearing expenditures as a proportion of total household expenditures are, on average: (a) 25 percent for one child, (b) 37 percent for two children, and (c) 44 percent for three children. Over three data periods, the analysis shows that the proportion of household expenditures devoted to children has increased, albeit somewhat less for families with one child (from 24 percent using 1980-86 data to 25 percent using 1998-2004 data) than for families with three children (39 percent to 44 percent).

Exhibit 3 compares the three sets of Betson-Rothbarth estimates for a range of net income. It shows little change over time.

Exhibit 3
Comparison of Measurements of Child-Rearing Costs
Developed by Using the Rothbarth Estimator over Time

USDA (2007 estimates)

The USDA estimates child-rearing expenditures individually for several expenditure categories (e.g., food, transportation, housing); then, adds them to develop a total. For some expenditure categories (e.g., housing), the USDA uses a per capita approach to estimate the child's share of the costs. That is, the USDA divide the expenditures for that particular good by the number of family members. Most economists believe this approach overstates the child's actual share of expenditures. The USDA updates its estimates every year for changes in the price level; however, the database for the current estimates is CES data from 1990-92. The USDA estimates expenditures for one child in a two-child family to be between \$7,830 and \$17,500 per year, depending on the age of the child and the income of the parents.

Comparisons

Exhibit 4 compares the estimates of child-rearing expenditures by the number of children. It shows that those estimated with the Engel methodology result in higher amounts on average than those estimated with the Rothbarth methodology. It also shows that the USDA estimates generally fall between the two methodologies.¹²

¹²The USDA estimates are based on gross income. The family-expenditures equivalent of the gross-income estimate, which is cited in Lino (2007), comes from a much older study. We do not know what tax and expenditures assumptions were made in the conversion. When we convert current USDA estimates from gross income to family expenditures using prevailing tax rates and expenditures data, we find that the USDA estimates are generally higher than the Engel estimates.

We note two caveats to Exhibit 4. First, it compares the average percentage of total family expenditures devoted to child-rearing expenditures, while the Arizona child support schedule relates to “gross income” rather than “total family expenditures.” Gross income and total family expenditures differ because of two factors: first, income taxes and some families spend more or less than their after-tax incomes. Later in this report, we convert these measurements back to gross income. Second, Exhibit 4 reflects “average” child-rearing expenditures across all income ranges, so it does not reflect how the estimates change when there is more income. Most economists find that the percentage of total family expenditures devoted to child-rearing expenditures declines as income increases.

DATA SOURCE OF THE ESTIMATES

With the exception of van der Gaag, all of the economists estimated child-rearing expenditures from the Consumers Expenditures Survey (CES) that is administered by the Bureau of Labor Statistics (BLS).¹³ Economists use the CES because it is the most comprehensive and detailed survey conducted on household expenditures and consists of a large sample. The CES surveys about 6,000 households per quarter on expenditures, income, and household characteristics (e.g., family size). Households remain in the survey for five consecutive quarters, with households rotating in and out each quarter. Most economists use at least three quarters or a year of expenditures data for a surveyed family. This means that family expenditures are averaged for about a year rather than over a quarter, which may not be as reflective of typical family expenditures.

¹³ van der Gaag’s study is more of a literature review of the evidence of child-rearing expenditures that existed in the early 1970s.

The BLS designed the CES to produce a nationally representative sample and samples representative of the four regions (Midwest, Northeast, South, and West). The sample sizes for each state, however, are not large enough to estimate child-rearing costs for families within a state. We know of no state that has seriously contemplated replicating the CES at the state level. The costs and time requirements make it prohibitive.

Specific Consumption Items

The CES asks households about expenditures on over a hundred detailed items. Exhibit 5 shows the major categories of expenditures captured by the CES. The CES focuses on **current** consumption. It includes the purchase price and sales tax on all goods purchased within the survey period.

Exhibit 5 Partial List of Expenditures Items Considered in the BLS, the Data Source Used to Estimate Child-Rearing Expenditures	
Housing	Rent paid for dwellings, rent received as pay, parking fees, maintenance, and other expenses for rented dwellings; and interest on mortgages, interest on home equity loans and lines of credit, property taxes and insurance, refinancing and prepayment charges, ground rent, expenses for property management and security, homeowners' insurance, fire insurance and extended coverage, expenses for repairs and maintenance contracted out, and expenses of materials for owner-performed repairs and maintenance for dwellings used or maintained by the consumer unit. Also includes utilities, cleaning supplies, household textiles, furniture, major and small appliances and other miscellaneous household equipment (tools, plants, decorative items).
Food	Food at home purchased at grocery or other food stores as well as meals, including tips, purchased away from home (e.g., full service and fast food restaurant, vending machines).
Transportation	Vehicle finance charges, gasoline and motor oil, maintenance and repairs, vehicle insurance, public transportation, leases, parking fees and other transportation expenditures.
Entertainment	Admission to sporting events, movies, concerts, health clubs, recreational lessons, television/radio/sound equipment, pets, toys, hobbies and other entertainment equipment and services.
Apparel	Apparel, footwear, uniforms, diapers, alterations and repairs, dry cleaning, sent-out laundry, watches and jewelry.
Other	Personal care products, reading materials, education fees, banking fees, interest paid on lines of credit, and other expenses.

Mortgage Payments

The CES does not include mortgage principal payment as part of current expenditures. However, the CES includes payment of the mortgage interest, rent among households dwelling in apartments, utilities, property taxes, and other housing expenses as indicated in the above table. As shown in Exhibit 6, even with the exclusion of the mortgage principal payments, these housing items comprise the largest share of total family expenditures. Housing expenses contribute to over a third of family expenditures.¹⁴

For purposes of developing child support schedules, states have found it beneficial that the CES excludes mortgage principal payments. In most situations, any home equity that exists is considered as part of the property settlement during the divorce.

¹⁴ Mortgage principal payments comprise about 5 percent of average after-tax income among two-parent families with children less than 18 years old. Calculated from BLS, *Table 5. Composition of consumer unit: Average annual expenditures and characteristics, Consumer Expenditure Survey, 2007*. Downloaded from <http://www.bls.gov/cex/tables.htm> on December 1, 2008.

Finance Charges

The CES does not capture finance charges (with the exception of finance charges for homes and vehicles). Specifically, it does not reflect any interest charges for items paid by credit card. It also does not capture interest charges for installment plans used to pay for furniture, household appliances, televisions and other electronics. Nonetheless, data from the Federal Reserve Board's Consumer Finance Survey (CFS) suggest that the finance charges not included in the CES are nominal.¹⁵ Almost half (46%) of families make fixed installment payments on automobiles loans; student loans; and, loans for furniture, appliances and other durable goods. Automobile loans, which are included in the CES, comprise many of these loans. Finance charges for household appliances, televisions, and other electronics are relatively insignificant when compared to finance charges on automobiles, which absorb less than one percent of family expenditures, on average.¹⁶

For the purpose of developing child support schedules, it would be ideal to capture these excluded finance charges for furniture and other items consumed by children. Yet, any bias created from excluding them is likely to be negligible because they appear to be nominal.

Exhibit 6 Composition of Average Spending by Families (adopted from Betson 2006)				
Expenditure Category	Childless Couple	Family with One Child	Family with Two Children	Family with Three or More Children
Total Annual Expenditures	\$44,728	\$46,140	\$49,834	\$48,341
Budget Share (Percentage of Total Expenditures)				
Food	16.0%	16.7%	17.2%	19.5%
Housing	36.6%	38.2%	38.3%	37.6%
Apparel	3.6%	4.1%	4.3%	4.6%
Transportation	21.7%	21.8%	21.0%	19.7%
Entertainment	6.0%	5.6%	6.3%	6.1%
Health Care	6.0%	5.3%	5.0%	4.8%
Personnel Care	0.9%	0.8%	0.8%	0.8%
Reading	0.5%	0.4%	0.4%	0.3%
Education	1.2%	1.5%	1.4%	1.4%
Personal Insurance	1.6%	1.2%	1.3%	1.1%
Miscellaneous	5.8%	4.3%	7.5%	3.5%

Transportation and Vehicle Payments

As shown in Exhibit 6, transportation expenses account for about one-fifth of total family expenditures. In the category of "transportation," the CES includes net vehicle outlays; vehicle finance charges; gasoline and motor oil; maintenance and repairs; vehicle insurance; public transportation expenses; and vehicle rentals, leases, licenses and other charges. The net vehicle outlay is the purchase price of a vehicle less the trade-in value. It accounts for

¹⁵ Brian Bucks, et al. "Recent Changes in U.S. Family Finances: Evidence from the 2002 and 2004 Survey of Consumer Finances," *Federal Reserve Bulletin*.

¹⁶ Bureau of Labor Statistics. *Table 49. Composition of consumer unit: Shares of average annual expenditures and sources of income, Consumer Expenditure Survey, 2007* Downloaded on December 1, 2008 from <http://www.bls.gov/cex/#tables>.

about 40 percent of all transportation expenses among families with children in the CES, which is seven percent of total household expenditures.¹⁷

In developing estimates of child-rearing expenditures, Betson excludes net vehicle outlays because it does not reflect that the vehicle can be sold again later after the survey period. In contrast, the USDA starts its estimates with all transportation expenses including net vehicle outlays. There are some advantages and disadvantages to Betson's approach. Like home equity, vehicles are part of the property settlement in a divorce. Nonetheless, the ideal would be to include a value that reflects depreciation of the vehicle over time.

Other Adjustments to the CES

Betson also excludes other expenditures items captured by the CES because they are obviously not child-rearing expenses. Specifically, he excludes contributions by family members to social security and private pension plans; and, cash contributions made to members outside the surveyed household. The USDA also excludes these expenses from its estimates of child-rearing expenditures.

Net Income

Gross and net incomes are reported by families participating in the CES. The difference between gross and net income is taxes. In fact, the CES uses the terms "income before taxes" and "income after taxes" instead of gross and net income. Income before taxes is the total money earnings and selected money receipt. It includes wages and salary, self-employment income, Social Security benefits, pensions income, rental income, unemployment compensation, workers' compensation, veterans' benefits, public assistance, and other sources of income. Income and taxes are based on self-reports and not checked against actual records.

The BLS has concerns that income may be under-reported in the CES. Although underreporting of income is a problem inherent to surveys, the BLS is particularly concerned because expenditures exceed income among low-income households participating in the CES. The BLS does know whether the cause is underreporting of income or that low-income households are actually spending more than their incomes because of an unemployment spell, being a student, or otherwise withdrawing from their savings. In an effort to improve income information, the BLS added and revised income questions in 2001, but there are no apparent differences resulting from these changes yet.

The Relationship of Expenditures to Income

Beside mortgage principal payments, the BLS also does not include changes in net assets or liabilities as income or expenditures. In all, the BLS makes it clear that reconciling differences between income and expenditures nor precisely measuring income are not part of the core mission of the CES. Rather, the core mission is to measure and track expenditures. The BLS recognizes that at some low-income levels, the CES shows that total expenditures exceed after-tax incomes; and, at very high incomes, the CES shows total expenditures are

¹⁷ Bureau of Labor Statistics, *Table 5: Composition of consumer unit: Average annual expenditures and characteristics, Consumer Expenditures Survey 2007*. Downloaded on December 1, 2008 from <http://www.bls.gov/cex/#tables>

considerably less than after-tax incomes. However, the BLS does not try to explain these differences.

In developing child support schedules, a long-standing assumption has been that at higher incomes the difference between after-tax income and expenditures is a form of “savings.” This includes traditional savings (i.e., deposits into a bank account) and other contributions to family wealth such as mortgage principal payments. For example, according to the most recent CES, high-income households (i.e., households with incomes over \$150,000 per year), the ratio of expenditures to after-tax income is 55 percent.¹⁸ This suggests a considerable amount of “savings.”

A high level of “savings” seems to contradict reports about the national savings rate being low. However, economists calculate the national savings rate using a different methodology.¹⁹ Some of the differences concern the treatment of housing and medical expenses. When calculating the national savings rate, economists define savings to be the difference between disposable income and consumption. In defining consumption, economists impute the rental value of housing to homeowners even though the rental value may exceed the mortgage payment. Similarly, economists impute the value of all medical services received even though there was insurance coverage and the family incurred no out-of-pocket expense. These imputed values increase consumption considerably; hence, reduce the national savings rate. In fact, the escalating cost of health services contributes significantly to the declining national savings rate.²⁰

USAGE OF ESTIMATES IN STATE GUIDELINES

States rely on various estimates of child-rearing expenditures as the basis of their guidelines. Some states rely on whatever was the most current estimate available at the time they developed or last revised their guidelines and have not updated as new estimates became available. Still other states made a deliberate choice to use one estimate over another. Often, these states chose the estimator based on which one produced guidelines amounts that differed the least from their current amounts.

Based on our current knowledge, we have counted the number of state guidelines by their economic basis. We note that many states modified the estimates or combined them with other information to arrive at their guidelines amounts. Consequently, even though some state guidelines share the same estimates, their guidelines amounts may differ. Another caveat to our counts is that some states recently have changed their guidelines or have adopted new guidelines that are not yet promulgated.

¹⁸ Calculated from BLS, *Table 2301. Higher income before taxes: Average annual expenditures and characteristics, Consumer Expenditure Survey, 2007*. Downloaded on December 1, 2008 from: <http://www.bls.gov/cex/tables.htm>

¹⁹ More information about this difference can be found in California's guidelines review report (Judicial Council, 2006).

²⁰ Ibid.

- The van der Gaag (1981) estimates form the basis of five state guidelines (i.e., California, Idaho, Nevada, New York, Wisconsin.) Most states that rely or have relied on the van der Gaag estimates use a flat percentage of obligor gross income to compute the child support obligation; that is, there is no consideration of the custodial parent's income. (California and Idaho are exceptions.)
- The Espenshade (1984) estimates forms the basis of about seven state guidelines. Most of these states have never updated their child support schedule. A notable exception is Michigan, which uses Espenshade's estimates for older children as the basis of its guidelines. Michigan updates Espenshade's estimates almost annually for changes in the price level.
- The Betson-Rothbarth (1990) estimates form the basis of about eight state guidelines. Many states that updated their guidelines beginning in the mid-1990s, including Arizona, relied on these estimates. Colorado, a state neighboring Arizona, still relies on these estimates.
- The Betson-Rothbarth (2001) estimates form the basis of about twelve state guidelines including Arizona. Many states that updated their guidelines at least twice since the mid-1990s rely on the second set of Betson-Rothbarth estimates.
- The Betson-Rothbarth (2006) estimates form the basis of six state guidelines (i.e., Arkansas, Louisiana, North Carolina, New Mexico, Oregon, and Rhode Island). Schedules based on these estimates have also been recommended or adopted in a few other states but have not yet been promulgated.
- The average of the Betson-Rothbarth and the Betson-Engel (2001) estimates form the basis of Georgia guidelines.
- Lino's USDA estimates form the basis of the Minnesota guidelines.²¹ Minnesota is the only state to rely on the USDA estimates.
- Kansas bases its guidelines on per capita estimates of child-rearing expenditures that are adjusted for routine parenting time (also called the "dissolution factor").

The above list accounts for the economic basis of about 39 state guidelines. In the remaining states, the economic basis is unknown or the basis is a combination of factors including previous county guidelines amounts and guidelines amounts in bordering states among others.

State-Specific Data. We know of no state that uses state-specific data as the basis of its guidelines formula.²²

Estimates for Single-Parent Families. We also know of no state that relies on expenditures in single-parent families as the basis of its guidelines formula. States that have considered expenditures in single-parent families typically reject those estimates because they often result in near-poverty amounts, are not available for high incomes (because too few single-parent families have high incomes), and are not consistent with the premise that the child should share the standard of living that the parent(s) can afford.

²¹ We do not know the year of the USDA study that forms the basis of the Minnesota schedule.

²² Some states have attempted to estimate child-rearing costs for their state but have not used the study findings to develop their guidelines.

Switch from Espenshade-Engel to Betson-Rothbarth Estimates

When most states were first adopting guidelines, the Espenshade estimates were the most current and credible estimates of child-rearing expenditures available. About twenty states including Arizona originally based their guidelines on the Espenshade estimates. Many states that updated their guidelines after 1990 switched to the Rothbarth estimates for several reasons. They are based on more current data. Betson recommended the Rothbarth estimate for state guidelines above the other four estimates he developed. Other economists with expertise in child-rearing expenditures have also recommended it (Barnow, 1994).²³ Another reason that states switched was that the new Rothbarth estimates produced less price-sticker shock than the new Engel estimates would.

Use of Other Estimates

Several states have seriously considered the Betson-Engel and USDA estimates when reviewing their guidelines formulas. States that consider the Betson-Engel estimates typically adapt the Lewin/ICF (1990) framework for analyzing the appropriateness of their schedule amount by comparing their guidelines amounts to the most recent Rothbarth and Engel estimates. Since Lewin/ICF found that the Rothbarth and Engel estimators formed the lower and upper bounds of credible estimates, they concluded that any amount in between these estimates is an appropriate guidelines amount.²⁴

Starting with this framework, one state, Georgia, eventually adopted a schedule based on the average of the Betson-Engel and Betson-Rothbarth estimates. The decision-makers assumed that the average would be the closest to actual child-rearing expenditures. Further, the average produced amounts more similar to the existing Georgia's guidelines amounts than the pure Betson-Rothbarth estimates did at the time.

Minnesota is the only state known to use the USDA estimates. Other state guidelines committees (e.g., Ohio) have recommended an updated schedule based on the USDA estimates but the proposed legislation containing the USDA-based schedule was not passed.

Adjustments to the Betson-Rothbarth Estimates

Most state guidelines schedules incorporate adjustments to the Betson-Rothbarth estimates.

²³ Barnow (1994) wrote, "The Rothbarth estimator then emerges as the closest to a consensus estimator, although, as noted above, it may well underestimate expenditures on children. States should bear in mind the potential bias of the Rothbarth estimator, and they may wish to consider increasing the Rothbarth figures slightly to account for the bias."

²⁴ When using this approach in 1990, Lewin found that most state guidelines were within the range of the estimates. Only eight state guidelines contained amounts below the low estimate and no state guidelines contained amounts above the high estimate. A subsequent study (Venohr and Griffith, 2005) partially updated the Lewin study. It found that the number of state guidelines containing amounts below the low estimate increased to 22 states. They attributed this to states not updating their schedules.

- Most states adjust the estimates to reflect current price levels.
- Many states with gross-income based guidelines adjust the estimates that relate to after-tax income to amounts that relate to gross income. States vary in their tax assumptions used to convert net to gross income.
- Many states adjust the Betson-Rothbarth estimates at low incomes to include a self support reserve.
- Some states with above- or below-average income realign the Betson-Rothbarth estimates, which are based on national data, to the income of their state (e.g., Connecticut).
- The District of Columbia applies the Betson-Rothbarth estimates to all after-tax income including what an intact family would spend on mortgage principal and “savings.”
- Rhode Island bases its schedule on the Betson-Rothbarth estimates with a modest upward adjustment to account for Rhode Island’s relatively high housing costs.
- In the Louisiana schedule, the Betson-Rothbarth estimates have been adjusted to incorporate a “dissolution factor” similar to the Kansas schedule. The dissolution factor acknowledges the obligated parent makes direct child-rearing expenditures when the child is in his or her care (i.e., during standard visitation).
- New Mexico split the difference between its existing and updated schedules when it last updated.

Economic Estimates Considered by Arizona

As mentioned earlier, Arizona switched from the Espenshade-Engel estimates to the Betson-Rothbarth estimates in the mid-1990s. At that time, Arizona checked the Betson-Rothbarth estimates, which were the first set of Betson-Rothbarth estimates, against Engel estimates produced by Professor James Shockey, University of Arizona.²⁵ Subsequently, Arizona updated its schedule using the second set of Betson-Rothbarth estimates in 2004. They form the basis of the existing Arizona schedule.

Arizona contracted with CPR to prepare an updated schedule based on the most recent Betson-Rothbarth estimates. Arizona did not contract with CPR to prepare multiple schedules based on other estimates or alternative assumptions.

Section III

Updated Schedule & Technical Steps

The core economic data used to develop an updated schedule consist of the following.

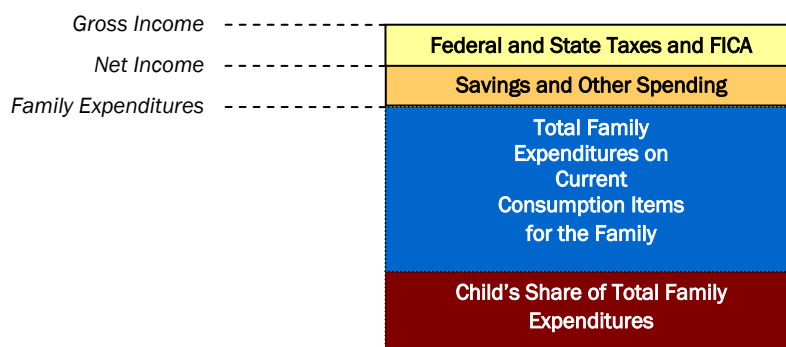

- The Betson-Rothbarth estimates of child-rearing expenditures derived from expenditures data collected from the 1998-2004 Consumer Expenditures Survey (CES). As discussed in the previous section, these estimates are updates to the estimates that form the basis of the current Arizona schedule.
- The 2008 Consumer Price Index published by the Bureau of Labor Statistics.
- Spending and income patterns of families participating in the 1998-2004 CES.
- Federal and State tax rates prevailing in 2008.

OVERVIEW OF STEPS USED TO UPDATE SCHEDULE

The estimates of child-rearing expenditures are just a starting point to developing the schedule. The steps used to update the Arizona schedule are outlined below.

1. *Adjust estimates of child-rearing expenditures to current price levels.* Betson developed his new estimates using July 2005 price levels. They are updated to October 2008 price levels using changes in the Consumer Price Index developed by the U.S. Bureau of Labor Statistics.
2. *Subtract child care expenses; health insurance premiums; and extraordinary, uninsured health care expenses from estimates of child-rearing expenditures.* This step is necessary because the actual amounts of these expenses are considered elsewhere in the guidelines.
3. *Extend the estimates of child-rearing expenditures to cover four and more children.* There are an insufficient number of families with four or more children in the survey. Hence, the estimates are extended to four and more children using economic equivalence scales. These scales were developed by the National Research Council, a blue-ribbon panel of academics studying poverty and family income, after extensive research.
4. *Relate the estimates of child-rearing expenditures to net incomes.* The Betson-Rothbarth estimates of child-rearing expenditures are expressed as a percentage of total family expenditures. If a family spends all of its after-tax income, then family expenditures and after-tax income are equal and no additional adjustment is necessary. However, as illustrated in Exhibit 7, some families may not spend all of their disposable income on current consumption items. Hence, the estimates of child-rearing expenditures are adjusted to reflect net incomes.

Exhibit 7
Family Consumption and Income

5. *Calculate marginal percentages.* This step is necessary to gradually phase-in the estimates of child-rearing expenditures between income ranges similar to how a tax table phases in different tax rates between income ranges. Otherwise, there would be sudden changes in amounts as the table moved from income range to the next income range.
6. *Back out the estimates of child-rearing expenditures to gross incomes.* The Arizona table considers the parents' gross incomes. Betson's estimates are backed out to net income in Step 4. In this step, they are backed out to gross income using the 2008 federal and Arizona income tax rates and FICA. Exhibit 7 also illustrates the need for this step.
7. *Update the income thresholds for federal childcare tax credit.* The current Arizona guidelines provide that the court may adjust child care costs factored into the calculation of the support award for the federal childcare tax credit. The adjustment is only made when the custodial parent's income is sufficient to have tax liability to which the credit applies. The guidelines provides a table noting these income thresholds. Although the table is outside the schedule, it is updated to 2008 levels in this report.

More detailed information about these steps and the data assumptions associated with each step can be found at the end of this section.

UPDATED SCHEDULE

Exhibit 8 contains updated schedule based on the above assumptions and steps.

DETAILED TECHNICAL STEPS AND ADDITIONAL DATA

There are six technical steps used to derive the updated schedule, from the numbers Betson provided, which are shown in Exhibit 9.²⁶ Specifically, Exhibit 9 shows the raw numbers from the 1998-2004 data used in critical steps: the percentage of total expenditures devoted to child-rearing expenditures for one, two and three children; the percentage of total expenditures devoted to child care expenses; the percentage of total expenditures devoted to extraordinary, uninsured health care expenses; and expenditures to net income ratios.

Child Care Expenses

Actual child care expenses are to be considered in the worksheet, so they are removed from the Betson-Rothbarth measurements when developing the schedule.

²⁶A seventh technical step updates the income thresholds for applying the childcare tax credit, which is outside the schedule.

Betson's measurements of child care expenses, which are shown in Exhibit 9, represent the average percentage of total expenditures devoted to child care expenses across all families regardless of whether the family incurs any child care expenses. If only those families with child care expenses were included, the percentages would be much higher. The percentage across all families is necessary to back out child care expenses from total child-rearing expenses since the total is derived for all families.

One limitation pertaining to child care expenses is that "necessary" child care expenses (e.g., those incurred to allow someone to work) cannot be distinguished from "discretionary" child care expenses. Ideally, only work-related child care expenses would be subtracted because most state guidelines only factor work-related child care expenses in the worksheet. State guidelines may consider child care expenses associated with a parent's job search or education aimed at increasing his or her earnings. Since they cannot be distinguished, however, work-related child care expenses may be somewhat overstated and too much may be subtracted from the estimates. In turn, this would cause the amounts in the obligation schedule to be somewhat less than if work-related and discretionary child care expenses could be separated. Nonetheless, since most child care expenses are work-related, discretionary child care expenses are likely to compose an infinitesimal share of total expenditures. As a consequence, the magnitude of any bias is likely to be negligible.

Health Care Expenses

Like child care expenses, actual health care expenses for the children (i.e., insurance coverage and extraordinary, uninsured medical expenses) are to be considered in the worksheet, so they are removed from the Betson-Rothbarth measurements when developing the schedule. Only the child's ordinary, uninsured medical expenses (e.g., bandages, over-the-counter medicines) are considered in the schedule. Ordinary medical expenses are limited to \$250 per child per year up to \$750 for three children and about \$75 for each additional child above three children. This amount approximates average out-of-pocket health care costs per child.²⁷

In the CES, health care expenses consider all out-of-pocket health-related expenses. This includes both prescription and over-the-counter medicines (e.g., aspirin); the employee's share of health insurance premiums, co-pays, and deductibles; orthodontia; and, other health-related expenses. Health care expenses on children cannot be distinguished from expenses on adult household members, so it is assumed that the child's share is the same as the child's share of total household expenditures. If the child's health care expenses actually cost more, on average, this will result in downward biases to the amounts in the obligation schedule because too little is subtracted from the estimates than the actual amount expended on the child's health care. Conversely, if the child's health care expenses actually cost less, on average, this will result in upward biases to the amounts in the obligation schedule. Nonetheless, if any bias exists, the amount is likely to be very small because uninsured health care expenses only compose a small portion of total expenditures.

²⁷ McCormick, R. Weinick, A. Elixhauser, et al. (2001) estimated it to be about \$250 using 2000 data. A study by Simpson et al. (2005) using 2001 data estimates out-of-pocket expenditures per child per year to be about \$100 to \$300 depending on family income. This includes office-based visits, prescribed medicine, and utilized hospital services. This does not include over-the-counter medicines, bandages, and similar expenses.

Detailed Technical Steps

Step 1: Update Betson's estimates to current price levels

Betson's most recent estimates are expressed as a percentage of total family expenditures for incomes in July 2005 dollars. The incomes are updated to 2008 price levels by using the Consumer Price Index published by the U.S. Bureau of Labor Statistics for October 2008.

Step 2: Subtract child care expenses; health insurance premiums; and extraordinary, uninsured health care expenses

The average percentage of total family expenditures attributable to child care expenses is now subtracted from the average percentage of total expenditures devoted to child-rearing expenditures for each income range. The child's share of out-of-pocket health care expenses is determined by multiplying the percentage of total expenditures devoted to the child by the percentage of total family expenditures devoted to health care expenses for each income range. It is also subtracted from the average percentage of total expenditures devoted to child-rearing expenditures. All of these percentages are shown in Exhibit 9. To illustrate this adjustment, look at the one-child expenditures for a family with \$100,000 annual income in 2005. The average family of that income spends 25.07 percent of the total family expenditures on the one child and 1.59 percent of expenditures is devoted to child care expenses and 0.54 percent is the amount of medical expenses after consideration of health insurance and ordinary medical expenses.²⁸ Hence, the adjusted amount is 25.07 percent minus 1.59 percent minus 0.14 (0.54 percent multiplied by 25.07 percent). The remainder is 23.34 percent.

Step 3: Extend percentages to six children

Betson's estimates only cover one, two and three children. The number of families in the CES with four or more children is insufficient to product reliable estimates. The National Research Council's equivalence scale, as shown below, is used to extend the three-child estimate to four and more children.²⁹

$$= (\text{Number of adults} + 0.7 \times \text{number of children})^{0.7}$$

Application of the equivalence schedule implies that expenditures on four children are 11.7 percent more than the expenditures for three children, expenditures on five children are 10.0 percent more than the expenditures for four children, and expenditures for six children are 8.7 percent more than expenditures for five children.

Step 4: Relate the estimates of child-rearing expenditures to incomes

The results from the above steps are child-rearing expenditures that are expressed as a percentage of total family expenditures. In this step, they are converted to a percentage of net income using the average ratio of expenditures to net income for a particular income range. The average is from the same families included in the data that Betson used to

²⁸ As previously discussed, the child care expenses are averaged across families that incur and do incur child care expenses. If only families that incur child care expenses were included, the percentage would be much higher. Families with older children, one working parent, relative care and other situations will not incur child care expenses. These families must be considered also.

²⁹ Citro and Michael (1995).

estimate child-rearing expenditures. (These percentages are shown in Exhibit 9.) To illustrate this adjustment, continue with our example from Step 2, which considers one child from a family with \$100,000 in annual net income. Exhibit 9 shows that families with \$100,000 in annual income (2005 dollars) spend 68 percent of their net income on current expenditures items, which is \$68,000 per year. In turn, a family spends a proportion of that on child-rearing expenditures.

Another way to express this, which is more useful for the development of guidelines, is the percentage of net income devoted to child-rearing expenditures. Continuing with our example, this is derived by multiplying the amount from Step 2 (23.34%) by the consumption ratio (68%). This results in the percentage of net income devoted to child-rearing expenditures without child care, health insurance premiums and uninsured, extraordinary medical expenses (15.87%).

The consumption rate used in this calculation is capped at 100 percent. This effectively assumes that families should not be required to spend more than their income. However, the actual data finds that on average families with incomes below about \$30,000 net per year spend more than their income.

Step 5: Calculate marginal percentages

At this point, we now have percentages of net income attributable to child-rearing expenditures for one to six children that do not include child care expenses, health insurance premiums, or uninsured, extraordinary medical expenses for several income ranges. To gradually phase between income ranges, we create marginal percentages by taking the ratio of (a) the difference in the base support amount between one income bracket and the next bracket and (b) the difference in the monthly net income between the same income brackets. Base support is calculated by applying the percentage of net income attributable to child-rearing expenditures to the midpoint of each income range. The results for one through three children are shown in Exhibit 10. The amounts for four or more children are calculated using the multipliers shown in the previous step.

The table of proportions shown in Exhibit 10 functions much like a tax schedule. The midpoint percentage is applied to the net income shown in Exhibit 10. The marginal percentage is applied to any net income above that amount and less than the amount of the net income in the next row. For example, if there is \$2,000 in net monthly income and one child, 25.06 percent is applied to the first \$1,616 in net income and 23.84 percent is applied to the remainder (\$384 = \$2,000 - \$1,616). The result is \$497, which is the sum of \$405 (\$405 = 25.06% X \$1,616) and \$92 (\$92 = \$384 X 23.84%).

Step 6: Back out to gross income

The results from Step 5 are child-rearing expenditures that are still expressed as a percentage of after-tax income. In this step, they are backed out to gross income using current tax rates. To be clear, the basic obligation is calculated for net incomes first from the table of support proportions shown in Exhibit 10, then backed out to gross income. Specifically, there is a hidden column for the net income equivalent to gross income in the schedule to which the Exhibit 10 table of proportions are applied. Exhibit 11 shows an excerpt of the

hidden column to help illustrate how an obligation table based on gross income is developed.

Exhibit 10 TABLE OF SUPPORT PROPORTIONS

Tax Assumptions

All income is assumed to be taxable and that it is taxable at the same rate; that is, all income is treated as if it is earned income subject to federal and State withholding and FICA tax formulas. Tax rates prevailing in 2008 were used to convert gross income based on federal and State employer withholding tax formulas.³⁰ Taxes are computed assuming (a) all income is taxed at the rate of a single individual;³¹ and, (b) two federal withholding allowances (one for a single exemption and one to simulate the standard deduction), based on IRS instructions.

Limitations to the Tax Assumption

One concern about this tax assumption is that it does not mimic the after-tax income available to an intact family. An intact family is likely to have more after-tax income than a single individual because the intact family claims more dependents and may be eligible for the child tax credit or the earned income tax credit (EITC). This translates to more after-tax income available for child support and a higher child support schedule.

³⁰ The Federal and FICA tax withholding formulas are provided in IRS (2008) *Circular E; Employer's Tax Guide*. The minimum State withholding percentage are: 10 percent of the federal tax withheld if annual income is less than \$15,000 and 19 percent of the federal tax withheld if annual income is \$15,000 or more. The State information is from the Arizona Department of Revenue (2008). *Arizona Withholding Tax Basics*.

<http://www.revenue.state.az.us/Withholding/menu.htm> Downloaded November 12, 2008 and Arizona Department of Revenue (2008) *Form A-4 Employee's Arizona Withholding Percentage Election*.

³¹ The IRS employer withholding formula is the same for single persons as it is for heads of household.

Another concern is whether it is appropriate to include the EITC. The employer withholding formula does not advance the Federal child tax credit and the full EITC, so it is not considered in the updated schedule. One reason that only part of the EITC is advanced is so that low-income families are not put in the precarious position of owing federal taxes when filing their tax return. Many states specifically exclude the EITC from income used to determine support because it is means-tested income.³²

Exhibit 11 Illustration of the Hidden Net Income Column in an Obligation Schedule				
Net Equivalent to Gross Income (Hidden Column)	Combined Adjusted Gross Income	One Child	Two Children	Three Children
3092	4000	753	1090	1283

3248	4250	778	1125	1324
3279	4300	783	1132	1332
3311	4350	789	1140	1340
3342	4400	794	1147	1348
3373	4450	799	1154	1356
3405	4500	804	1161	1364

Other concerns pertain to the head-of-household filing status and child tax credit. The IRS does not discern between single and head-of-household filing status in its employer withholding formula, nor does it advance the child tax credit. Further, typical income ranges of single-parent families make them ineligible or only partially eligible for the child tax credit. If the parent is working, the family is likely to be eligible for the EITC, which phases out at about \$30,000 gross per year. Without taxable income, there is nothing to which a tax credit can be applied. Finally, most Income Shares guidelines adjust for the childcare tax credit (calculated from IRS Form 2441) in the calculation of work-related child care expenses, rather than in the conversion of gross to net income.

Step 7: Update income thresholds for child care tax credit

The final step actually does not apply to the schedule; rather, it updates the income thresholds provided in the guidelines for which there is sufficient income for the federal child care tax credit to apply. The guidelines provide that the court can add child care expenses less the federal childcare tax credit to the basic obligation, as well as a simplified formula to calculate the childcare tax credit. We do not recommend changes to the simplified formula because the maximum childcare tax credits at incomes where there is a tax liability, \$50 for one child and \$100 for two or more children, have not changed.³³

³² For examples, see the Michigan and Wyoming child support guidelines.

³³ They are deducted from IRS Form 2441: Child and Dependent Care Expenses. According to the IRS, the tax credit can be applied for annual child care expenses up to \$3,000 for one child and \$6,000 for two or more children. (The monthly equivalents are \$250 and \$500, respectively). The minimum credit is 20 percent, which amounts to \$50 per month for one child and \$100 per month for two children.

However, we recommend changes to the income thresholds for which there is sufficient tax liability to benefit from the federal childcare tax credit. The 2008 income thresholds are:

- \$1,750 for a custodial parent with one child;
- \$2,550 for a custodial parent with two children;
- \$2,850 for a custodial parent with three children;
- \$3,150 for a custodial parent with four children;
- \$3,450 for a custodial parent with five children; and
- \$3,700 for a custodial parent with six children.

These thresholds reflect gross incomes that produce a tax liability equivalent to the maximum child care credit. For example, a taxpayer filing as a head of household with one child would have about \$50 in federal tax liability when his or her gross income is \$1,750 per month.

The income thresholds differ considerably from the previous amounts because they consider tax liability prior to the application of the Earned Income Tax Credit (EITC), which is consistent with the IRS application.³⁴ Specifically, the IRS also applies the childcare tax credit prior to the EITC. (The previous amounts erroneously considered tax liability after application of the EITC.)

³⁴ The previous income thresholds were: \$2,100 for one child; \$2,600 for two children; \$2,700 for three children; \$2,800 for four children; \$3,050 for five children; and \$3,300 for six children.

Section IV

Comparisons and Conclusions

The Arizona child support schedule is updated in this report using the most current economic data available in 2008. The schedule is based on the same assumptions as the existing schedule; that is:

- The schedule does not include expenditures on child care; extraordinary, uninsured medical expenses, and children's share of health insurance costs;
- The schedule includes expenditures on ordinary medical care (e.g., bandages, over-the-counter medicines);
- The schedule is based on economic data that represent average child-rearing expenditures from ages 0 through 18 years old; and
- The obligated parent's direct expenditures on the children while they are in his or her care (e.g., during scheduled visitation or physical custody) are not considered in the schedule.

COMPARISONS

Exhibit 12 summarizes the data underlying the current and updated schedules. Arizona's current schedule is generally based on 2002 economic data. The proposed, updated schedule is generally based on 2008 economic data.

Exhibit 12 Data Used to Develop and Update the Arizona Child Support Schedule

Tax Rates	2002 Federal and State withholding formulas and FICA	2008 Federal and State withholding formulas and FICA

Most of the recent economic data produce increases to the schedule.

- The new estimates of child-rearing expenditures combined with changes in average expenditures on child care and out-of-pocket medical expenses result in an average increase of six percent. The change varies by income range and number of children.
- Changes in price levels have resulted in an 11 percent increase on average. Actual price levels have increased by 20 percent since the existing schedule was developed, but the impact on the schedule is less because income has essentially increased, too. Price changes have a larger impact on higher incomes than lower incomes.
- Federal tax reform in 2003 makes more after-tax income available for child support. It produces a two percent increase to the schedule on average. The tax effects are the highest around combined gross incomes of \$3,500 per month and at very high incomes.

When combined, the average increase is 15 percent. It is not equivalent to the sum of its parts (i.e., the average increases bulleted above) because the percentage change varies by income range and number of children.

The Impact of Future Tax Changes. The tax decreases promulgated under the Jobs and Growth Tax Relief Reconciliation Act of 2003 will rescind in 2010. Congress and President Obama, however, indicate that they will make the decrease permanent for most incomes. President Obama proposes an exception at very high incomes. Based on the current proposal, we estimate it would decrease the schedule amounts above \$20,000 per year by about one percent.

Schedule Extends to \$30,000. Because the new data include more high-income families, the highest combined income in the schedule increases from \$20,000 to \$30,000 gross per month.

Average Change

Exhibit 13 summarizes the average changes to the schedule by number of children. A side-by-side comparison between the existing and proposed schedules is provided in Appendix A. Exhibit 13 considers changes to the basic obligations before they are prorated between the parents and before other factors are considered such as parenting time, child care expenses and health insurance.

Increases. As evident, in Exhibit 13, on average, the update produces higher basic obligations.

Decreases. Only one part of the update indicates a decrease to the basic obligations. (This is evident in the side-by-side comparisons in Appendix A.) There is an anomaly for one child at gross incomes of \$1,000 to \$2,250. The new data indicate nominal decreases of \$1 to \$4 per month to the basic obligation at this income range. We believe that part of this decrease is due to capping family expenditures so they do not exceed income. The data suggest that low-income families spend more than their income. However, in developing the

child support schedule, we cap expenditures to income, so the guidelines do not expect parents to spend more than their income.

Exhibit 13 Summary of Changes to Basic Obligations in Schedule (Note that this is the combined increase, the actual increase in order amounts will be less due to the obligated parent's prorated share)			
	1 Child	2 Children	3 or More Children

• Average	\$ 69	\$195	\$350
• Median	\$ 70	\$197	\$356

CASE EXAMPLES

Minimum-Wage Case

Many states will impute income at minimum wage to parents whose employment is erratic or who have little employment history. When the Arizona guidelines were last reviewed in 2002, the federal minimum wage was \$5.15 per hour. This amounts to \$893 gross per month assuming full-time employment. In 2007, Congress increased the federal minimum wage and authorized that the increase occur in phases. The final increase occurs in July 2009 and will result in a minimum wage of \$7.25 per hour. This amounts to \$1,257 gross per month. Exhibit 14 shows the amounts under the old and new minimum wage as well as under the new minimum wage under the existing and proposed schedule. These amounts assume no child care or health insurance expenses.

Exhibit 14 Comparison of Order Amounts: Each Parent Works Full-Time Minimum Wage						
	1 Child		2 Children		3 Children	
	Order includes <u>no</u> parenting time adjustment	Order includes adjustment for 130 parenting days	Order includes <u>no</u> parenting time adjustment	Order includes adjustment for 130 parenting days	Order includes <u>no</u> parenting time adjustment	Order includes adjustment for 130 parenting days
Existing Schedule (2002 minimum wage: \$5.15/hr, \$893/mo)	\$193	\$95	\$272	\$134	\$315	\$155
Existing Schedule (2009 minimum wage: \$7.25/hr, \$1,257/mo)	\$253	\$125	\$352	\$174	\$407	\$201
Proposed Schedule (2009 minimum wage: \$7.25/hr, \$1,257/mo)	\$254	\$125	\$368	\$182	\$433	\$214

³⁵ *Supra* note 5. Most of the 14 percent of three and more children cases involve three children: 11 percent involve three children and 3 percent involve four or more children.

Exhibit 14 shows that the increase in minimum wage has substantially increased order amounts over time under the existing schedule. For example, the one-child amount increased from \$193 to \$253 per month due to the minimum-wage increase alone. However, the amounts of the minimum-wage orders differ little between the existing and proposed schedules using the 2009 minimum wage. For example, the increase for the one child-amount would be \$1 per month (from \$253 to \$254 per month). This occurs for several reasons: there is little change in expenditures patterns at low incomes, there is little change in after-tax incomes, and total family expenditures are capped at this income range such that they do exceed income.

Adjustment for Parenting Days. Exhibit 14 also illustrates the impact of the adjustment for parenting days. Exhibit 14 compares the order amounts for no parenting days and 130 parenting days using Table A. A parenting plan where the obligated parent has the child every other weekend, two weeks during the summer, one week during the winter and half of the holidays results in about 130 parenting days per year. In this scenario, the parenting-time adjustment reduces the order amounts by over half. For example, the one-child amount under the existing schedule for when both parents have full-time earnings at the 2009 minimum wage (\$1,257 per month) is \$253 per month when there is no parenting time and \$125 per month when there are 130 parenting days. The adjustment for 130 parenting days is .253 of the schedule amount. Although not shown in Exhibit 14, the existing schedule amount for this scenario is \$505 per month, so the amount of the parenting time adjustment is \$128 (.253 X \$505). As discussed in the scenario considering a low-income obligee and a higher income obligor, the timesharing adjustment is relatively high.

Average Incomes

According to the case file review, the average incomes of obligors and obligees are \$4,046 and \$2,558 gross per month, respectively. The average child care expense is \$412 per month and typically is paid by the obligee.³⁶ The average health insurance expense is \$132 per month and paid by the obligor slightly more often than the obligee. The most common parenting-time arrangement is in the range of 88 to 115 days. Assuming a case based on these circumstances, Exhibit 15 compares the order amount under the proposed and existing schedule for one, two and three children. It shows a nominal increase to the monthly one-child amounts (a \$28 increase from \$609 under the existing schedule to \$637 under the proposed schedule) and larger increases for two and three children. As an aside, the increases between one child to two children and two to three children are overshadowed by fixing the child care expenses at \$412 regardless whether there are one, two or three children; that is, the increase would be more if we would have increase the child care expenses with more children.

³⁶ However, according to the case file review (Venohr and Kaunelis, 2008), most cases (65%) do not have paid child care expenses.

Exhibit 15			
Comparison of Order Amounts for Case with Average Circumstances			
Obligor Income = \$,4046; Obligee Income = \$2,558; obligee pays \$412 child care expenses, obligor pays \$132 for the children's health insurance and there are 110 parenting days.			
	1 Child	2 Children	3 Children
Existing Schedule	\$609	\$751	\$818
Proposed Schedule	\$637	\$826	\$931

High Incomes

About 10 percent of the cases in the case file review involved parents with combined gross incomes more than \$10,000 per month. For this scenario, we also use average child care expenses of \$412 (paid by the obligee) and health insurance cost of \$132 (paid by the obligor). We assume the parents have equal incomes (\$5,000 each) and that the obligated parent has 130 days with the child. Exhibit 16 compares the order amount under the proposed and existing schedule for one, two and three children.

Exhibit 16			
Comparison of Order Amounts for High-Income Case			
Obligor Income = \$5,000; Obligee Income = \$5,000; obligee pays \$412 child care expenses, obligor pays \$132 for the children's health insurance and there are 130 parenting days.			
	1 Child	2 Children	3 Children
Existing Schedule	\$410	\$501	\$587
Proposed Schedule	\$428	\$551	\$672

Low-Income Obligee and Large Income Discrepancy

One concern expressed by the Committee is the guidelines amounts in cases where the parents have a large income discrepancy and the obligee has low income. The concern is that the current guidelines produce order amounts that insufficiently provide for the child in the obligee's home. We believe the problem is inherent in the Arizona's parenting-time adjustment, not the Income Shares schedule. To illustrate this problem, we consider a scenario involving two children, an obligee whose gross income is \$1,500 per month, an obligor whose gross income is \$4,500 per month, the mother is the obligee, and the father is the obligor. We rely on the existing schedule for this scenario.

Line 4 of Exhibit 17 shows that the father would owe the mother \$876 per month for child support if no timesharing adjustment were applied. However, if the father has 177 parenting days, Line 7 of Exhibit 17 shows the child support order would only be \$298 per month using Table A. If Paragraph 12 is applied— and it could indeed apply since the time spent with each parent is essentially equal— Line 10 of Exhibit 17 shows that the father would owe the mother \$292 per month.

The order amounts using either Parenting Time Table A or Paragraph 12 (\$298 and \$292, respectively) barely cover the children's food costs when the children are in the obligee's home. According to the U.S. Department of Agriculture, the monthly food costs for two children would be \$384 for a low-cost plan and \$490 for a moderate-cost plan.³⁷ Even if

³⁷ United States Department of Agriculture (2008), *Official USDA Food Plans: Cost of Food at Home at Four Levels: U.S. Average*, November, 2008. The low-cost food budget is often used to determine payment schedules in bankruptcies. It represents food consumption among those from 25th to 50th quartile in food consumption.

the two children consume only half of their food at their mother's house, this would be \$192 and \$245 per month. After food, little is left from the \$298 support order for the obligee to cover the children's housing expenses, clothing and other child-rearing expenses.

In contrast, the obligor received a \$578 credit for his timesharing costs. (This is shown on Line 6 of Exhibit 17.) The obligor can more reasonably afford food and other expenses for the children based on this credit than the obligee can based on the order amount.

Basis of the Arizona Timesharing Adjustment

Arizona has a unique parenting time adjustment. The amount of the Arizona adjustment is essentially based on the obligor's child-rearing expenditures during his or her parenting time, rather than how much the obligee's child-rearing expenditures are reduced when the children are with the obligor. Specifically, the Arizona adjustment recognizes that the obligor incurs food and housing expenses for the child, but it does not recognize that the obligee cannot always reduce the child's housing expenses when the child is with the obligor. The obligee cannot rent the child's bedroom or completely shut off electricity to the child's bedroom when the child is with the obligor.

Arizona loosely based its adjustment on a concept developed in Indiana that assumes that there are three types of child-rearing expenditures:

- time-variable expenses that if one parent incurs the expense, the other parent does not (e.g., the child's food and some entertainment such as movie tickets);

tion. The Moderate food budget represents those from the 50th to 75th quartile in food consumption. Downloaded January 27 from <http://www.cnpp.usda.gov/USDAFoodPlansCostofFood.htm>

- fixed, duplicated expenses that both parents incur to care for the child (e.g., housing); and,
- fixed, unduplicated expenses that one parent is likely to incur but are not related to time with the child (e.g., the child's clothing and portable media player). ³⁸

At low-levels of timesharing, the obligated parent only receives credit for time-variable expenses. But, when timesharing becomes substantial, the obligated parent also receives credit for fixed, duplicated expenses. In its original concept, the obligated parent never receives a credit for fixed, unduplicated expenses. New Jersey and Indiana guidelines, which are the only state guidelines to fully incorporate this concept, presume that the parent that incurs the child's fixed, unduplicated expenses is the parent with more timesharing; or, in cases involving equal timesharing, the parent who lives closest to the children's school. The consequence of this presumption is that even in equal income, equal-timesharing cases, the adjustment does not produce a zero order because the obligated parent will have to pay his or her share of fixed, unduplicated expenses. In its pure approach, the Indiana approach results in order amounts close to the more popular cross-credit timesharing adjustment used by Colorado and several other states.³⁹

When Arizona first adopted Parenting Time Table A in the mid-1990s, it embraced the Indiana concept. However, in the guidelines narrative, it allowed for a zero order when the parents have essentially equal incomes and equal timesharing. This effectively eliminated the concept that one parent would incur fixed, unduplicated expenses. Additional changes made in the late 1990s intended to smooth out the adjustment inadvertently resulted in the Arizona adjustment generally producing support awards lower than the Indiana and cross-credit adjustment.

For example, continue with the scenario in Exhibit 17 that involved two children, an obligee whose income is \$1,500 gross per month and the obligor whose income is \$4,500 gross per month. Exhibit 18 compares the order amounts for this case using Arizona Parenting Time Table A, the Colorado cross-credit formula, the Indiana timesharing adjustment, and the New Jersey timesharing adjustment. The comparisons start with the Arizona schedule amount before any adjustments, then each state's timesharing adjustment method is applied. The adjusted monthly order amount is: \$298 under the Arizona Parenting Time Table A adjustment, \$463 under the Colorado cross-credit adjustment, \$532 under the Indiana timesharing adjustment, and \$876 under the New Jersey timesharing adjustment. The New Jersey amount is the same as the sole-custody order amount because New Jersey guidelines provide that the timesharing adjustment cannot be applied when the sum of the obligee's after-tax income and the timesharing-adjusted order is less than 200 percent of the federal poverty level.

³⁸ Venohr, Jane (2006) "Chapter 7: Behind Time-Sharing Adjustments in Child Support Guidelines, in Brown, Ronald and Morgan Laura, editors, *2006 Family Law Update*, Aspen Publishers, New York,, New York.

³⁹ The cross-credit adjustment recognizes that the obligor incurs direct child-rearing expenditures during parenting time but that it does not always diminish the child's needs in the obligee's home. The cross-credit adjustment essentially recognizes that it costs more to raise a child in two households than one household.

Mathematical Basis of Parenting Time A. Exhibit 19 shows the basis for some of the Parenting Time Table A. For example, it shows that the 0.12 adjustment percentage for 4 to 20 parenting time days was arrived at by taking the midpoint of 4 to 20 parenting days (12 days as shown in Column C), dividing that by 365 days per year (3.3 percent, as shown in Column D), and multiplying that by 38 percent (which Arizona presumed was the percent of child-rearing expenditures expended on variable costs).⁴⁰ Still another example is at 173 to 182 parenting time days. At this range, the adjustment is solely based on the percent of time the children spend with the obligor (i.e., the amount in Column D). This is not consistent with the premise that some child-rearing expenses, such as housing, are duplicated between the parents. It essentially presumes that all child-rearing expenses are time-variable.

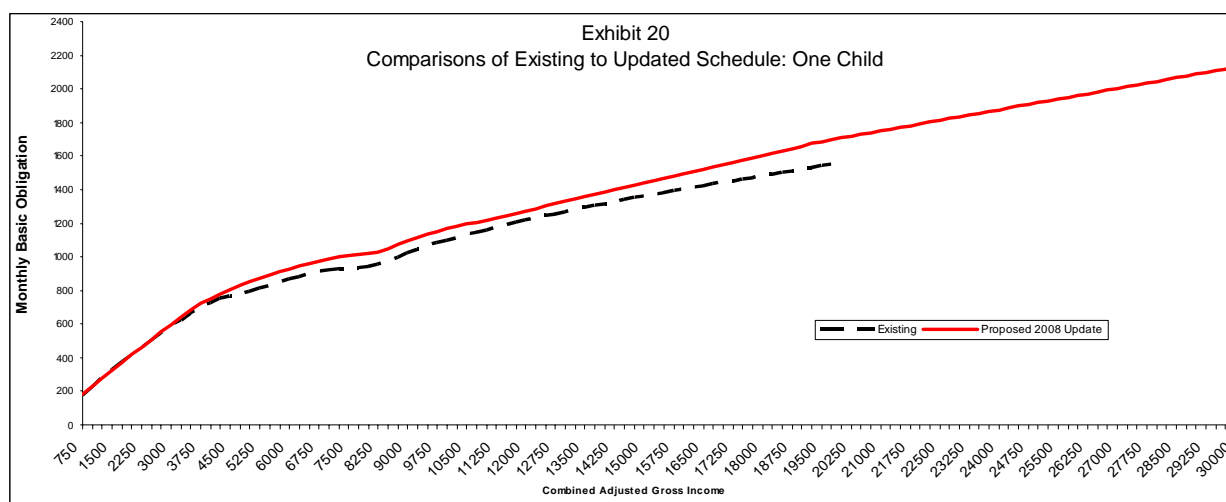

Exhibit 19 highlights where we were able to determine the mathematical basis of Table A in yellow. We believe that the un-highlighted areas are those changes made in the late 1990s that were intended to make the adjustment more gradual.

⁴⁰ Venohr (2006) provides a more detailed discussion of the percentage of child-rearing expenditures devoted to each of the three categories. Arizona relied on a percentage developed by Shockey (1995).

Graphical Comparisons

Exhibits 20, 21 and 22 compare the basic obligations for one, two and three children. These are the schedule amounts prior to the consideration of each parent's pro rata share, additional expenses, and the timesharing adjustment. Appendix A provides a tabular side-by-side comparison of the schedule amounts.

CONCLUSION

The Arizona schedule is based on 2002 economic data. Price increases and other economic changes warrant an update to the schedule.

INTRODUCTION

Arizona is currently reviewing its child support guidelines in accordance to State statute and Federal regulation.¹ As part of the federal requirement, states must analyze case data...

gathered through sampling or other methods, on the application of, and deviations from, the guidelines. The analysis of the data must be used in the State's review of the guidelines to ensure that deviations from the guidelines are limited.

This report summarizes the findings from Arizona's case file review. A Court-appointed Committee will consider the findings as well as public comment, other research and additional information from many sources for the review. In turn, the Committee will recommend guidelines changes to the Arizona Supreme Court. The guidelines are promulgated through Arizona Supreme Court Administrative Order No. 2004-29. The Court posts more information about the review on its website URL: <http://www.supreme.state.az.us/csgrc/> Individuals may also submit comments and suggestions to the Committee from this website.

BACKGROUND

Federal regulations require each state to establish one guidelines for setting and modifying child support award amounts. The guidelines are to be applied presumptively, but states must also establish criteria for rebutting the presumption if the application of the guidelines would be unjust or inappropriate for a particular case scenario. The deviation criteria must also consider the best interest of the child. The guidelines are to be used by all persons whose duty is to set child support orders. States must review their guidelines at least once every four years.

Arizona last revised its guidelines on January 1, 2005. The revisions were part of a review that began in 2002 and ended in 2004. It included a similar analysis of case file data and a report of the findings (PSI 2003). The Court contracted with Center for Policy Research (CPR) to collect and analyze case file data for this review.

SAMPLING AND DATA COLLECTION

Arizona has conducted four case file reviews since the quadriennial review requirement was first imposed in 1989. The previous reviews took place in 1995, 1999, and 2002. All of the reviews considered a random sample of recently established or modified child support orders. The 1999 and 2002 review relied on a stratified random sample. The strata consist of Maricopa, Pima, Santa Cruz, and Yavapai Counties. For consistency, CPR also relies on a stratified random sample using the same counties except CPR replaced Santa Cruz County with Apache County. The 1999 and 2002 reviews cumulated into two reports. The 2002 report contains findings from both the 1999 and 2002 reviews. We rely upon it in this report to analyze trends in child support orders and guidelines usage.

¹ Arizona Revised Statutes § 25-320(D) and Title 45, Public Welfare, CFR 302.56.

Sample Size. The 1999 and 2002 reviews relied on a sample of 267 orders and 431 orders, respectively. The sample size necessary to detect statistical differences in the guidelines deviation rate since 2002 is 270 orders. Nonetheless, this study targeted a sample size of 440 orders to be comparable to the 2002 sample size. CPR oversampled by 25 percent, then rounded up the sample size when distributing it across counties and county offices. The total targeted sample size was 615 orders. Exhibit 1 shows the targeted sample size for each county, the actual sample size, and other information.

Child support worksheets were available for 578 of the 615 orders (94% of the sampled cases). The worksheet contains much of the detailed information needed for the analysis (e.g., parents' incomes, the amount of the child's insurance). CPR eliminated orders without worksheets for the analysis. CPR also eliminated one order because it established two orders in a third-party custodian case (i.e., both the mother and father were ordered to pay support to the child's custodian). CPR also eliminated an additional nine cases because it was obvious that the worksheet sent to CPR was not the actual worksheet that formed the basis of the order. (As an aside, a case file may contain multiple worksheets reflective of variations in the child support calculation or differences in information submitted by the petitioner and respondent.) In all, this resulted in 568 orders for the analysis.

Exhibit 1: Sample Selection						
	Apache County	Maricopa County	Pima County	Yavapai County	Subtotal of the Four Counties	State Total
Total population (2007 Census)	71,118	3,768,123	946,362	208,014	4,993,617	6,166,318
% of State Total	1.2%	61.1%	15.3%	3.4%	81.0%	100.0%
New Orders Established by IV-D Agency (FY2007)	36	4,162	1,201	332	5,731	7,702
% of State Total	0.5%	54.0%	15.6%	4.3%	74.4%	100.0%
Child Support Orders Entered (2007 County Clerk Records)*	68	6,935	1,911	407	9,321	Unknown
Targeted Sample Count	30	410	120	55**	615	Not Applicable
Actual Sample County	27	385	110	46	568	Not Applicable

*Includes IV-D and non-IV-D orders. IV-D refers to Section IV-D of the Social Security Act that requires states to develop a child support program to establish and enforce support in public assistance cases and make these services available to non-public assistance cases. Maricopa County includes modified orders. Pima County is estimated based on cases filed in 2007.

**This is broken down into two locations: Prescott (35 cases) and Verde Valley (20 cases).

Data Collection and Entry. With the assistance of the AOC, IV-D agency, and County Clerks, CPR obtained a list of orders entered or filed in calendar year 2007 from each of the sampled counties. Then, CPR generated a random sample from those lists. CPR retained staff from the County Clerk offices to copy the orders and supporting guidelines worksheets of the random sample. The staff also noted whether the parents attended parenting education. (The Court case file contains a form indicating parent education attendance.) CPR entered the data into an EXCEL workbook.

Data Limitations and Assumptions. Information was limited to what was available on the order or worksheet. Counties use slightly different forms and some have two different forms. This results in at least three small data issues.

- Since not all forms allow for the option of “equal parenting time” for “custody,” we assumed that any cases where the worksheet indicates 173 to 182.5 parenting days was essentially equal parenting time. (As an aside, none of the worksheets indicated that Parenting Time Table B was used.) We considered the assumption that any case where the worksheet indicates 143 to 182.5 parenting days was essentially equal parenting time because the Guidelines assumes that certain child-rearing costs are substantially or equally shared by both parents above 143 parenting days; however, this would have masked the issue of zero orders. Almost half (45%) of cases where the number of parenting days is 173 to 182.5 have zero orders. In contrast, only 20 percent of cases where the number of parenting days is 143 to 172 have zero orders. The sample contains 84 orders with 173 to 182.5 parenting days and 30 orders with 143 to 182.5 parenting days.
- Secondly, in some counties where the worksheet asks “custody” instead of “primary residential parent,” it appears that some users entered the parent(s) with legal custody rather than the parent(s) with primary residence. CPR used the number of parenting days on the worksheet and information from the order to correct this.
- Finally, most guidelines forms do not include space for the equal parenting time/unequal income adjustment provided in Guidelines Paragraph 12; yet, some counties have developed a separate form to apply it. Still some parents try to apply Paragraph 12 to the worksheet that does not have space for the Paragraph 12 calculation. Because of this, it is often difficult to surmise whether Table A or Paragraph 12 was used to adjust for parenting time when there is essentially equal custody.

In addition, the completeness of the worksheet limited information for analysis. For example, many worksheets noted only the amount of the parenting time adjustment, but not the number of days or what adjustment was applied; nonetheless, the missing information could often be deduced from the calculation. For example, when only the adjustment percentage was noted, we assumed that the number of parenting days was the midpoint of the range of days corresponding to the percentage.

Terminology. Other limitations concern terminology. Although “custody” in Arizona family law refers to legal custody, we sometimes use “custodial parent” to indicate the parent who is the primary residential parent. Similarly, we use the term “noncustodial parent” to indicate the parent who is not the primary residential parent. We also use the terms, “obligor” and “obligee,” to indicate the parent with a duty to pay support and the parent to receive support, respectively. These terms do not always correspond to the timesharing arrangement because it is possible under the Guidelines calculation for the primary residential parent to be the obligor if there is substantial timesharing, the primary residential parent has higher income than the other parent, or due to additional child costs such as child care. Most orders identified which parent was the obligor even when there was a zero-order based on whom would be the obligor using the guidelines-calculated amount prior to the deviation. In cases where an obligor was not identified, CPR identified the obligor as being the parent who would have paid support under strict application of the Guidelines.

FINDINGS FROM THE CASE FILE REVIEW

Characteristics of the Cases

Obligees in the Cases. As in the previous case file reviews, the majority of parents who make child support payments, or the “obligors” in the case, are male (87%). In other words, 87 percent of the “obligees,” or the parents who receive the child support payment, are female. Exhibit 2 compares the gender of the obligees in the 2007 sample with the gender of the obligees in the 2002 and 1999 samples.

While the percentage of female obligees in Arizona has decreased over time, as evident in Exhibit 2, it is still greater than the percentage of female obligees at the federal level, which is 84 percent (Census 2007). This national statistic, however, is based on a different measurement than the one used in the Arizona reviews (which parent has primary custody versus which parent actually pays the child support). Still, the majority of child support cases across the country are those in which the mother has primary custody and receives support from the father.

Order Types. The majority of the 2007 sample (84%) consist of “traditional” child support orders; that is, cases where one parent is the primary residential parent and the other parent owes support. In most of these traditional orders (89%), the mother is the primary residential parent and the father pays child support.

As shown in Exhibit 3, 15 percent of the orders involve essentially equal parenting time. Of these orders:

- More than three-quarters (76%) are cases where the father has more income and would be the obligor under strict application of the guidelines;

- 18 percent are cases where the mother has more income and under strict application of the guidelines would be the obligor;
- Three percent of the cases involve parents with equal incomes; and
- The remaining three percent are orders where additional expenses alter which parent would pay support under strict application of the guidelines.

Finally, Exhibit 3 shows few orders (1%) involve split custody; that is, where there are at least two children and each parent is the primary residential parent for at least one child.

Children Covered in the Cases. Most (87%) of the cases reviewed cover one or two children. Exhibit 4 shows the number of children covered in the child support cases in the 2007, 2002, and 1999 samples.

In the 2007 sample, the average age of the youngest child and oldest child covered in the order are 7.1 years and 9.0 years, respectively. This is similar to the past two case file reviews. In the 2002 sample, the average age of the youngest child was 7.8 years and the average age of the oldest child was 9.6 years, while in 1999 the average age of the youngest child and oldest child was 7.5 years and 9.5 years, respectively.

Parents' Incomes

In the 2007 sample, monthly income averages \$2,558 among obligees and \$4,046 among obligors. Median monthly income is \$2,094 among obligees and \$3,000 among obligors. The average gross monthly incomes of obligees and obligors have increased since the previous case file

review. Exhibit 5 compares the average gross monthly incomes of obligees and obligors in the 2007 sample to the incomes in the 2002 and 1999 samples.

Exhibit 5 shows that average gross monthly incomes have steadily increased over time. This appears to result from an increase in the proportion of high earners. As evident from Exhibit 6, which gives more details on the changes in the parents' incomes over time, the percent of parents with gross incomes above \$3,000 per month has increased significantly. For example, in 2002, just over a third (36%) of obligors had gross incomes more than \$3,000 per month. In 2007, that proportion has grown to almost half (48%).

On the other hand, the number of obligees and obligors earning less than \$1,000 per month, as evident in Exhibit 6, has decreased since 2002. Some of this decrease may result from the change in Arizona's minimum wage. In 2002, Arizona used the federal minimum wage of \$5.15 per hour. At this rate, a person working 40 hours per week would earn \$893 per month. The minimum wage in Arizona has increased to \$6.90 per hour. An employee working full time at the new minimum wage rate would earn \$1,196 per month. Effective July 24, 2009, the federal minimum wage will increase to \$7.25 per hour, which is \$1,257 per month for a full-time worker.

High Incomes. Exhibit 6 breaks down the \$3,001 or more incomes further for the 2007 sample. (Similar information is not available from the 2002 report.) It shows four percent of the obligees and 13 percent of the obligors have gross incomes more than \$6,001 per month. However, it is unusual for both parents to have high incomes. For example, only two percent of orders involve cases where both parents have gross incomes above \$6,001 (i.e., a combined income above \$12,001 per month).

**Exhibit 6. Gross Monthly Incomes over Time
(% of orders)**

	2007 Sample (n=568)	2002 Sample (n=427)	1999 Sample (n=267)
Obligee's Gross Monthly Income			
\$1000 or less	12% *	26% *	30%
\$1,001-\$2,000	36%	34%	43%
\$2,001-\$3,000	26%	25%	20%
\$3,001 or more	26% *	16% *	7%
• \$3,001 to \$4,000	12%		
• \$4,001 to \$5,000	6%	N.A.	N.A.
• \$5,001 to \$6,000	4%		
• \$6,001 or more	4%		
Obligor's Gross Monthly Income			
\$1,000 or less	4% *	12%	12%
\$1,001-\$2,000	24%	29%	34%
\$2,001-\$3,000	24%	23%	26%
\$3,001 or more	48% *	36% *	28%
• \$3,001 to \$4,000	19%		
• \$4,001 to \$5,000	12%	N.A.	N.A.
• \$5,001 to \$6,000	5%		
• \$6,001 or more	13%		

* The 2007 amount is a statistically significant change from the previous review, $p < .05$

Combined Incomes above the Schedule. Approximately two percent of the 2007 sample have a combined gross income over \$20,000 per month. This is important because the Arizona guidelines' schedule does not cover combined incomes over \$20,000 per month. For incomes above that, the guidelines provide that the highest amount on the schedule shall be used and a parent requesting more bears the burden of proof of evidence that child-rearing expenses should be more. The case file review suggests that this provision is applied infrequently. About one-third (36%) of the orders where the combined income exceeded \$20,000 per month involved a guidelines deviation. (Caveats to this are: the deviation may reflect another reason; and, a request for deviation may have been denied.) Half of these deviations were in an upward direction, the other half were in a downward direction.

Of the cases involving combined incomes over \$20,000 gross per month, the average order amount is \$1,282 per month, the orders range from zero to \$3,371, and nearly half (46%) of these orders cover one child. The average order amount in these cases is less than the highest amount on the schedule for one child, which is \$1,561 per month or eight percent of \$20,000. On average, the order amount absorbs about five percent of the obligor's gross adjusted monthly income in these cases. The order amount as a percent of the obligor's gross adjusted monthly income ranges from zero to eight percent. These are relatively low order amounts, particularly when considering that most of income is from one parent in these cases. The obligor's income averages 71 percent of the combined income in these cases. The median is 79 percent of combined income.

Percent of Combined Income. The Arizona Guidelines uses the Income Shares Model. This model prorates most costs of raising a child between the parents based on each parent's share of the combined income. Therefore, we analyze the obligor's income as a percentage of the parents' combined income. Exhibit 7 gives information on the obligor's income as a percentage of combined income over time.

Exhibit 7. Obligor's Income as a Percent of Combined Income (% of orders)			
	2007 Sample (n=568)	2002 Sample (n=427)	1999 Sample (n=267)
0-15%	1%	1%	0%
16-30%	6%	7%	5%
31-45%	17%	17%	19%
46-60%	29%	31%	30%
61-75%	30%	25%	29%
76-90%	13%	10%	10%
91-100%	5% *	10% *	6%
Average	59%	59%	60%

* The 2007 amount is a statistically significant change from the previous review, $p < .05$

As shown in Exhibit 7, the obligor's income is approximately 60 percent of the combined income in the 2007, 2002, and 1999 samples. This means that, in the Income Shares Model, the obligors are responsible for an average of 60 percent of the child-rearing expenses.

Exhibit 7 also indicates a significant decrease in the percent of cases where the obligor has income but the obligee has essentially no income. This is evident by the decrease in the percent of cases at the 91-100% range.

Monthly Order Amounts

In 2007, the average child support order is \$460 per month. This is a slight increase from the 2002 and 1999 averages, which were \$455 and \$447, respectively. The median child support order is \$407 per month among 2007 orders.

Exhibit 8 gives more information about the order amounts in 2007, 2002, and 1999. As shown in Exhibit 8, 39 percent of the orders in 2007 were set at amounts over \$500 per month. Eighty percent of these orders were between \$500 and \$1,000 per month, while 20 percent of these orders were over \$1,000 per month.

Of the orders that are below \$100 per month, the majority (89%) are less than \$50. These orders make up 16 percent of the total sample. This is a statistically significant increase from the 2002 and 1999 samples, where orders under \$50 per month made up only six percent and one percent, respectively, of the total sample.

Zero-Dollar Orders

Zero-dollar orders have also increased since the last review. In 2007, these orders are 14 percent of the total sample, while in 2002, these orders made up only five percent of the total sample. This increase is statistically significant.

Guidelines Applied. More than a quarter (26%) of the zero-dollar orders followed the guidelines. Several different case circumstances in the 2007 sample produced a zero-dollar order when the guidelines are applied.

- The obligor has zero income or the self-support reserve test brought the order down to zero.
- The combination of the parenting time adjustment and additional child-rearing costs paid by the obligor offset the obligor's share of the basic obligation. For example, in one case the obligor pays \$500 of additional educational expenses, which was more than his share of the basic obligation adjusted for parenting time.
- The parents have essentially equal incomes and equal parenting time.
- The child receives Social Security benefits.

None of these reasons contribute significantly more or less to zero-dollar orders.

Guidelines Deviations. The remaining zero-dollar orders (74% of all zero-dollar orders) result from guidelines deviations. Besides almost equal parenting time (53% of these cases involved essentially equal parenting time), there appears to be some common characteristics of these orders.

- Almost one half (48%) of zero-dollar orders based on a deviation started with a guidelines-calculated amount of \$100 or less. Obviously, these parents zeroed out the order. Many of these cases involved essentially equal parenting time. We also questioned whether more cases were actually in this category but the worksheet did not reflect it. Although we did not examine every step taken in worksheet calculations, we did spot-check a few worksheets

with equal parenting time and discovered that the guidelines amount would have resulted in a different amount had the parenting time adjustment been applied to the other parent or Table A was used instead of Paragraph 12, or vice versa.

- About one-third (33%) involved cases where the obligor's income was less than or equal to the obligee's income or the obligor's monthly income was less than \$2,400. This suggests that the parents may have agreed to a zero dollar order to increase the obligor's self-support reserve.

Yet, in some cases, the basis for the deviation to a zero-dollar order was not obvious. The obligor in these cases clearly has more income and less parenting days than the obligee and there were no substantial additional child-rearing expenses such as child care expenses.

Applications of Adjustments

Parenting Time Adjustments

A parenting time adjustment was applied in 88 percent of the cases in the 2007 sample. This is a statistically significant increase from 2002, when 77 percent of the cases had a parenting time adjustment applied. The parenting time adjustment is based on the concept that when the non-custodial parent spends time with the child, some of the costs of caring for the child are directly absorbed by that parent. And, as the noncustodial parent spends more time with the child, more of the costs will shift away from the custodial parent onto the noncustodial parent.

To determine the adjustment to the child support order, the total number of days (a period of more than 12 hours is considered one day) the noncustodial parent spends with the child over the course of a year must be calculated. Once this is calculated, one of three adjustments may apply under the Guidelines.

- The most common way is to apply Parenting Time Table A, which contains adjustment percentages based on the number of parenting time days with the obligor. Table A is the genesis of the existing Arizona parenting time adjustment. Initially promulgated in the mid-1990s, Table A recognizes that when the child is with the obligor, the obligor incurs some time-variable child-rearing expenses directly such as food. Table A also recognizes that when the obligor has substantially more time with the child, the obligor incurs more of the child's variable expenses as well as housing and transportation expenses for the child. Hence, the adjustment percentage becomes larger as the number of parenting-time days increase. In its original form, the adjustment percentage never resulted in a zero-dollar order because it was believed that even when there is equal timesharing, one parent would control more child-rearing expenditures than the other parent; namely, the child's clothing and other personal items. As evident in Paragraph 11 of the current guidelines, however, this concept has been abandoned, at least in Table A.² As an aside, only three other states guidelines (Indiana,

² This is based on the commentary following Table A. It states that "[C]ertain costs usually incurred only in the custodial household are assumed to be substantially or equally shared by both parents [when the number of parenting days exceed 143 days.] These costs are for items such as the child's clothing and personal care items, entertainment and reading materials."

Missouri, and New Jersey) base their parenting-time adjustment on a similar concept and all of these states have retained the concept of controlled expenses. We also note that Table A was refined over time by making the increments of parenting day ranges smaller and modifying the percentage adjustments.

- The guidelines also include a Parenting Time Table B. It was added to the guideline after Table A was promulgated. It is intended to provide adequate support in cases where there is substantial timesharing (the obligated parent has over 143 days) and the parents do not equally share child-rearing expenses, rather one parent does indeed incur more of the expenses for the child's clothing and similar expenses. In effect, Table B retains the original principle of Table A that even in equal timesharing cases, one parent will incur the "controlled" child-rearing expenses.
- Finally, the current Guidelines provides Paragraph 12, which is to be applied in essentially equal timesharing cases. This adjustment has also evolved over time. As we recall, in its original form, it allowed for zero-dollar orders in equal timesharing and equal income cases. In effect, it addressed a criticism of the original Table A adjustment: it did not result in zero-dollar orders in equal timesharing and equal income cases while the more popular timesharing adjustment method in other state guidelines did.³ It appears that since then, Paragraph 12 has been expanded to also address essentially equal timesharing cases when the parents' incomes are not equal.

None of the worksheets in the 2007 sample noted use of Table B, nor did any in the 2002 review. Although it appears that most cases used Table A to adjust for parenting time, it is not entirely clear how often Paragraph 12 was used. In some of the handwritten worksheets, it was obvious that the person completing the worksheet contemplated whether to use Table A or Paragraph 12.

Exhibit 9 shows the ranges of parenting days per year — the same ranges found in Table A — used to adjust the child support obligations in the 2007 sample. As shown in this exhibit, 17 percent of the cases with an adjustment use an adjustment of 173 to 182 parenting days per year. The majority of these cases (78%) were equal parenting time. Twenty-one percent of the cases with a parenting time adjustment are based on the 88 to 115 day range. For this range, the non-custodial parent receives a 16.1 percent decrease to the monthly obligation.

Exhibit 10 compares the parenting time days used in the 2007, 2002, and 1999 samples. There has been a steady increase (statistically significant from 1999 to 2002 but not from 2002 to 2007) in the amount of cases with a four to 72 day adjustment. The percent of cases using the 73 to 129 parenting day range decreased from 60 percent in 1999, to 54 percent in 2002, down to 36 percent in 2007. The decrease from 2002 to 2007 is statistically significant. More cases used the 130 to 182 day adjustment in 2007 than in 2002. The percent of cases increased from 15 percent to 29 percent. This increase is statistically significant.

³ The cross-credit formula is the most popular timesharing adjustment in state guidelines. An example of the cross-credit formula is contained in the Colorado guidelines. It results in a zero-dollar order when there is equal timesharing and equal incomes.

In all, 15 percent of the 2007 sample involved cases with essentially equal physical custody, which is significantly more than the 2002 sample. As an aside, we could only find one other state (Wisconsin) that tracked custody changes over time and no comparable national data. Wisconsin also finds an increase in equal parenting time. Among divorce cases in Wisconsin, the incidence of equal custody has increased from 15 percent in a 1996-99 sample to 24 percent in a 2003-04 sample (Brown and Canican 2007). We note that the Arizona and Wisconsin samples are not perfectly comparable. The Arizona sample included divorced and never married parents. The Wisconsin sample was limited to divorced parents. Generally, divorced parents are more likely to have parenting time agreements than never-married parents.

Age of the Child in Equal Parenting Time Cases. Many of the children in essentially equal parenting time cases are younger: 13 percent are infants or toddlers; 36 percent are of preschool or kindergarten age; 34 percent are of secondary school age; and 18 percent are teens.

Adjustment for Older Children

The Arizona guidelines apply an adjustment for children over the age of 12 to account for the presumption that older children can cost a parent up to 10 percent more to care for than younger children. An older child adjustment was applied in 30 percent of the cases in the 2007 sample. This is less than the proportion of cases in the 2002 sample with this adjustment (32%) though greater than the proportion of cases in the 1999 sample with the adjustment (24%).

Adjustment for Low-Income Obligor

In each child support case, the Arizona Guidelines require that the court perform a self-support reserve test to ensure that the obligor can afford to pay the child support order and still maintain a minimum standard of living. To do so, \$775 is deducted from the obligor's adjusted gross income. If the resulting amount is less than the child support order, the Court has the option to reduce the child support amount to the resulting amount. When determining whether to reduce the order amount, the Court also must take into consideration the financial situation of the obligee. In the 2007 sample, less than five percent of the obligors received the low-income adjustment. This is slightly less than the six percent of obligors that received the adjustment in 2002.

Adjustments to the Parents' Income

When calculating the child support order, the Arizona guidelines allow adjustments to be made to the parents' gross income for other support obligations. These obligations include:

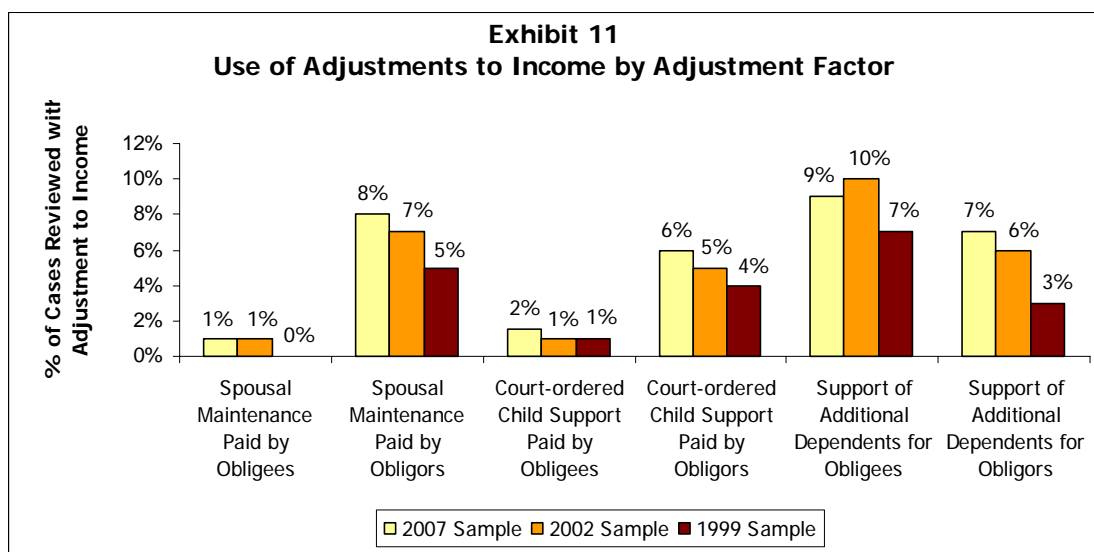

- Court-ordered spousal maintenance;
- Court-ordered child support for children from other relationships; and
- Support of other dependents in the household who are not included in a child support order.

It is important to note that this analysis cannot determine how many parents actually pay spousal maintenance, court-ordered support for other children, or support other dependents. We can only determine whether the Court took the payments into consideration when determining the parents' gross incomes.

Exhibit 11 compares the use of these income adjustments in 2007 to the 2003 and 1999 samples. It shows that spousal maintenance payments were subtracted from the incomes of one percent of the obligees and eight percent of the obligors in the 2007 sample. The average amount deducted for spousal maintenance payments was \$1,300 for obligees and \$1,268 for obligors. In the 2002 sample, the average amounts were \$630 for obligees and \$1,295 for obligors.

The court does not often include an adjustment to parents' income for court-ordered child support for children in other relationships. In the 2007 sample, only two percent of obligees and six percent of obligors had their incomes reduced for this reason. The 2002 and 1999 samples also had few parents with court-ordered child support adjustments. The average amount deducted was \$427 for the obligees and \$380 for the obligors in the 2007 sample, an increase from \$348 for obligees and \$365 for obligors in the 2002 sample.

The adjustment for support of additional dependents is also infrequently used when determining parents' income for the 2007 sample. 10 percent of obligees and seven percent of obligors received an adjustment for this reason. The average amount subtracted in 2007 for obligees and obligors were \$521 and \$602, respectively. In 2002, the averages were \$424 for obligees and \$508 for obligors.

Adjustments to the Order for Additional Expenses

To determine the basic child support obligation, the court takes into consideration the cost of a child's medical, dental, and vision insurance; childcare costs; education expenses; and extraordinary expenses for a special needs or handicapped child. Either the obligor or the obligee can pay for these expenses. If the obligor pays, the child support obligation is reduced. Conversely, if the obligee pays, the child support obligation increases. Exhibit 12 gives more information on how often these adjustments were made to child support orders in the 2007, 2002, and 1999 samples.

As shown in Exhibit 12, the percentage of cases considering these additional expenses has remained stable since the 2002 case file review. Nearly two-thirds of the cases (65%) have an adjustment for a child's medical insurance. The average adjusted amount for medical insurance are:

- \$132 in the 2007 sample;
- \$108 in the 2002 sample; and
- \$91 in the 1999 sample.

On average, obligors spent approximately 3.5 percent and obligees spent 4.9 percent of their gross income on medical insurance for their children. Most (83%) of the obligors and 70 percent of obligees who paid for insurance spent less than five percent of their gross income on medical coverage. This is important because in July of 2008, the federal government passed new medical support rules that defined medical insurance as reasonable in cost if “the cost to the parent responsible for providing medical support does not exceed five percent of his or her gross income or, at State option, a reasonable alternative income-based numeric standard defined in State law” [45 CFR §303.31(a)(3)].⁴

⁴ *Federal Register*, vol. 73, No. 140 (July 21, 2008, pages 42416-42442).

The Arizona Guidelines mandate that all child support orders assign a parent to provide medical insurance. In the 2007 sample, the mother was ordered to provide insurance in 40 percent of the cases, the father in 49 percent of the cases, and both parties were ordered to provide the insurance in 11 percent of the cases. This is slightly different than the 2002 sample, which found the mother ordered to provide insurance in 42 percent of the cases, the father ordered in 54 percent of the cases, and both parents ordered in four percent of the cases.

In seven percent of the cases, neither parent was ordered to provide medical insurance. These children may be covered by Medicaid or KidsCare, Arizona's State Child Health Insurance Program (SCHIP), because their parents do not have employer-provided insurance available. There was a decrease in the percentage of these cases from the 2002 sample, when 20 percent of cases did not specify a parent to provide medical insurance.

The guidelines also instruct the court to specify how much of a child's uninsured medical expenses each parent has to pay. These amounts are not taken into consideration when the child support order is calculated. In the 2007 sample, the court ordered the obligor to cover an average of 55 percent of the uninsured costs and the obligee to pay an average of 45 percent. Typically, the court splits the uninsured costs between parents 50/50 or prorates the split according to the parents' incomes.

A little more than one-third of the cases (35%) include an adjustment for child care costs. On average, the adjusted amounts for child care costs are \$412 a month in the 2007 sample and \$323 in the 2002 sample.

In the past three case file reviews, only four percent of the cases included an adjustment for education expenses. The guidelines define these expenses as costs incurred for sending a child to a private or special school or any other necessary costs to meet the educational needs of a child. The average adjusted amounts are \$327 in the 2007 sample, \$130 in the 2002 sample, and \$197 in the 1999 sample.

The Guidelines instruct the court to increase the child support obligation to provide for handicapped or special needs children. Only one percent of the cases included this type of adjustment. The average cost adjustment in the 2007 and 2002 sample were \$80 and \$79, respectively.

Deviations from the Guidelines

The Arizona Guidelines mandate that the court deviate from the child support guidelines when:

- It is inappropriate or unjust to apply the guidelines; and
- It is in the best interest of the child to deviate.

The court has the option to deviate if both parents agree to the new amount. Exhibit 13 shows the deviation rate from the 2007, 2002, and 1999 samples.

While the deviation rate did increase from the 2002 to the 2007 sample, the increase is not statistically significant. Exhibit 14 gives more information about the deviation reason, direction, and amount in the 2007, 2002, and 1999 samples.

Exhibit 14. Deviations from the Guidelines Over Time			
	2007 Sample (n=568)	2002 Sample (n=427)	1999 Sample (n=267)
Percent of cases with a deviation	26%	22%*	15%
Did the deviation occur due to an agreement between the parents			
➤ Yes	77%	78%*	56%
➤ No	23%	22%	44%
Direction of the deviation			
➤ Upward	30%*	49%*	58%
➤ Downward	70%*	51%*	42%
Average Amount of the Deviation			
➤ Upward Deviations	42%*	74%*	22%
➤ Downward Deviations	-67%*	-48*	-24%

* Statistically significant change from the previous review, $p < .05$

As shown in Exhibit 14 more than three-quarters (77%) of the deviations were the result of a written agreement between the parents. In these cases, the majority of the deviations were in a downward direction (66%).

Other reasons for the deviations given included:

- The best interest of the child in 10 percent of the cases;
- The court found that the application of the guidelines was inappropriate or unjust in three percent of the cases; and

- In the remaining 11 percent of the cases, there was no reason stated in the order although there may have been a verbal record.

Another possible reason for a deviation is rounding. Oftentimes, there is a deviation from the guidelines and the order amount only slightly changed. To estimate this effect, rounding was attributed to cases with deviations where the difference between the order amount and the worksheet amount was less than either \$25 or five percent. Based on these calculations, 19 percent of the deviations are due to rounding. Most of these small deviations were due to an agreement between the parent (70%) or there was no reason given (19%). If rounding-error is not considered to be a deviation, the deviation rate would be 21 percent.

Characteristics of Deviated Orders

The characteristics of deviated orders vary widely in timesharing arrangements, incomes, additional child-rearing expenses, and other characteristics. Due to the wide variations, CPR could develop only a few generalizations about the characteristic of deviated orders. In all, CPR was able to develop three categorizations of deviations; however, they account for only two-thirds of the deviations.

- In almost one-third (31%) of deviated orders, parenting time was essentially equal. In most (71%) of these cases, the order was deviated downward to zero. Many deviated downward from a guidelines-calculated amount of less than \$100 per month to zero. Yet, there were also many non-zero order amounts entered in essentially equal parenting time cases. Some resulted in upward deviations and others resulted in downward deviations.
- In almost one-quarter (24%) of deviated orders, it appeared that an upward deviation was made because the obligee had relatively low income (i.e., less than \$2,500 gross per month) or because the obligor had considerably more income than the obligee.
- In eleven percent of deviated orders, it appeared that the order was deviated downward (but not to zero) because of the obligor's relatively low income (i.e., less than \$2,500 gross per month) or because the obligee had more income than the obligor.

None of these categorizations comprise a substantial share of the total 2007 sample: equal parenting-time cases with deviations comprise eight percent of all orders; low-income obligee cases with deviations comprise six percent of all orders; low-income obligor cases with deviations comprise three percent of all orders; and the remaining deviations comprise five percent of all orders. Further, the subcategory of equal parenting-time cases that deviated to a zero order, which comprises only six percent of the total 2007 sample, is not substantial.

Deviation Rates in Other States

Some nearby states (i.e., California and New Mexico) have lower deviation rates. However, neither of these studies were based on a representative sample of all child support orders like the Arizona study is. New Mexico finds a deviation rate of three percent (NM Child Support Enforcement Division 2007) and California finds a deviation rate of nine percent (Judicial Council

of California 2006). The New Mexico sample considers only orders established by the State child support agency and the agency requests guidelines deviations infrequently. The California study includes only cases with standardized order forms, worksheets, or other information sufficient to determine whether the guidelines were applied. Since California does not strictly include this information in the case file, often orders based on agreement between the parents do not contain this information. Many California parents also prefer this because they do not want their income information placed in a case file that is of public record. A more apt comparison to Arizona may be Washington State, which like Arizona more rigorously includes worksheets in the case file. Washington finds a guidelines deviation rate of 29 percent (Stirling 2002).

Parenting Education

Arizona law mandates that all divorcing and never-married parents with minor children and custody access disputes attend a parenting education class. In the 2007 sample, 74 percent of obligees and 53 percent of obligors attended parenting education. Exhibit 15 compares the percentage of obligors and obligees that attended parenting education in the 2007 and 1999 samples. (These data were not collected in 2002.) One factor that may explain the lower attendance rate among obligors than obligees are orders entered by default. If the obligor does not stipulate or attend a hearing, he/she may also be less likely to attend parenting education. Based on the data we collected, we could not tell whether the parents were at the trial or if the order was entered by default or stipulation.

As shown in Exhibit 15, the percentage of obligees attending parenting education has remained stable over time, while the percent of obligors attending decreased; yet, the decrease is not statistically significant. Both parents attended in just under half (48%) of the cases.

More obligors attended parenting education when they had equal timesharing or the order amount deviated from the guidelines. However, obligee attendance rates did not vary in these circumstances from the overall obligee attendance rate. Seventy-one percent of the obligors with equal timesharing attended parenting education and 64 percent of the obligors with deviated

orders attended parenting education. (These are statistically different from the attendance rate for all obligors, $p < .05$). The higher obligor attendance rates suggest that obligors in these circumstances are more vested parents. Obligor willing to care for their children for an equal amount of time are obviously more vested parents, but this characteristic is less obvious among obligors with deviated orders. Nonetheless, recall that most of the deviations resulted from agreement between the parents, so these obligors may also be more participatory parents.

The attendance rates also differed in cases with zero-dollar orders. (Recall, that the “obligor” in a zero-dollar case is the parent who would have paid support prior to adjustments.) In zero-dollar cases, the obligor attendance rate is 64 percent, but the difference is less statistically significant ($p < .10$) from the overall obligor attendance rate. Moreover, a caveat to this finding is that many zero-dollar orders involve essentially equal parenting time, which is driving the higher attendance rate among all zero-dollar cases. When we limit the sample to zero-dollar orders where the obligor has less than equal parenting time (43 orders meet these criteria), the obligor attendance rate is only 49 percent. (This is not statistically different from the 53% attendance rate among all obligors.)

Another interesting finding concerns obligee attendance rates in zero-dollar cases where the obligor has less than equal parenting time. The obligee attendance rate in these cases (93%) is statistically more ($p < .05$) than the obligee attendance rate for all cases (74%). Other salient findings about these cases are: 65 percent of them are based on deviations and median obligor income was generally lower in these cases compared to all cases (\$1,433 gross per month among cases with both zero-dollar orders and less than equal parenting time compared to \$3000 gross per month for all cases). The obligee agreed to the deviation in most of these cases, oftentimes through oral testimony.

SUMMARY AND RECOMMENDATIONS

Arizona is reviewing its child support guidelines. As part of the review, researchers have collected case file data and analyzed it. The analysis considers the application of and the deviation from the guidelines. Federal regulation encourages states to:

- limit guidelines deviations; and
- use the findings from the case file review to recommend guidelines changes that will reduce the numbers of guidelines deviations and result in awards that are just and appropriate and considerate of the best needs of the child.

SUMMARY OF FINDINGS

Guidelines Deviations

The guidelines deviation rate increased from 22 percent in 2002 to 26 percent in 2007; however, the difference is not statistically significant. Further, if cases with round-off error are considered (i.e., a difference of less than 5% or \$25), the deviation rate would be 21 percent. Like the last review, the vast majority of guidelines deviations resulted from agreement between the parties.

More of the deviations are downward. No typology characterized the majority of cases based on deviated orders. The most common typology was essentially equal timesharing cases but they comprised just less than one-third of all deviations.

Order Amounts

Order amounts, on average, did not change since the last guidelines review. They average \$460 per month in the 2007 sample.

Zero-Dollar Orders. The most striking finding from the 2007 sample is a significant increase in zero-dollar orders. They account for 14 percent of the cases reviewed in 2007 compared to 5 percent of the cases reviewed in 2002. Most of the zero-dollar orders resulted from guidelines deviations rather than from application of the guidelines. Many of these cases deviated down to zero involved essentially equal parenting time, a guidelines-calculated amount less than \$100 that was rounded down to zero, or both.

Orders Based on the Low-Income Adjustment. The 2005 Guidelines amendments increased the amount of the self support reserve allowable to the noncustodial parent from \$710 to \$775 per month. Despite the increase, the adjustment is not being applied more often than it was applied in 2002.

Orders in Cases with Combined Incomes above \$20,000. The current schedule considers combined adjusted gross incomes up to \$20,000 per month. Above that level, the guidelines provide that the highest amount of the schedule shall be used unless evidence is provided to justify a higher amount. This guidelines provision was applicable to only two percent of the 2007 sample. Often the order amounts in these cases were less than the highest amount on the schedule. There were relatively few deviations at this income range.

General Guidelines Usage Patterns

With the exception of the parenting time adjustment, there is little change in the guidelines application and case characteristics since the last review. In general, allowable adjustments to income (i.e., adjustments for spousal maintenance, child support paid to other families, and support of other children) produce usage patterns similar to the last review. The allowable add-ons to basic child support obligations (i.e., add-ons for medical/dental/vision insurance; childcare, education expenses, and extraordinary child expenses) also produce similar usage patterns to the last review.

Parenting Time Arrangements and Adjustments

Most of the 2007 orders considered parenting time and more of the 2007 orders considered parenting time than orders in the 2002 sample did. No case relied on Table B to adjust for parenting time. Although it appears that most cases used Table A to adjust for parenting time, it is not entirely clear how often Paragraph 12 was used. In some of the handwritten worksheets, it was obvious that the person completing the worksheet contemplated whether to use Table A or

Paragraph 12. In other worksheets, it appeared that the user was unsure which parent got the parenting time adjustment.

Patterns in the amount of parenting time have also shifted. In the 2002 sample, parenting time adjustments reflected amounts based on “traditional visitation,” such as every other weekend, holidays, and one month in the summer. In 2007, however, just over one-third (36%) of parenting-time arrangements reflect amounts in line with “traditional visitation.” Instead, there was an increase in cases with more timesharing, particularly equal time, and more cases with less timesharing.

Cost of Insurance

On average, parents spend less than five percent of their gross income to insure their children.

Parenting Education Attendance

In the 2007 sample, 74 percent of obligees and 53 percent of obligors attended parenting education. Obligor attendance was more often when their order was based on a deviation or the obligor had equal parenting time.

RECOMMENDATIONS

Based on the analysis, CPR recommends the following.

- No changes to the deviation criteria.
- Changes to the standardized order and worksheet forms.
- Simplify the parenting time adjustments for use by unrepresented parents.
- Consider the findings of the case file review when developing a threshold for determining reasonable cost of health insurance.
- Consider ways that the guidelines can better address cases with combined adjusted gross incomes above \$20,000 per month, the highest amount on the schedule.
- Review the reasons for an increasing trend in zero orders and consider their consequences; specifically, whether they may require changes to the guidelines or other recommendations.

No Changes to the Deviation Criteria. We did not find any overwhelming evidence pointing to possible changes to the deviation criteria that would improve the application of the guidelines. Instead, we recommend the Committee consider whether these cases could be better addressed through changes to Paragraph 12 (Equal Custody) or the worksheet forms; and, contemplate the appropriateness of zero-dollar orders.

Recommended Form Changes. It is important to make the standard obligation and worksheet form as clear as possible for use by self-represented parents.

- *Counties should be encouraged to develop gender-neutral order forms.* Specifically, the forms should allow the user to circle either the “mother” or “father” as the obligor, rather than presume that the father is the obligor. Presuming the father is the obligor may obscure that Paragraph 12 could be used in essentially equal parenting-time cases.
- *On the guidelines worksheet, counties should be encouraged to adopt Maricopa County’s terminology, “the primary residential parent is...” rather than ask which parent is the “custodial parent.”* Clarification of this term may help direct self-represented parents to which parenting time adjustment should apply to their case circumstance. The primary residential parent is the parent with the most parenting time. It appears that some users indicate the parent(s) with legal custody rather than the primary residential parent on worksheets that ask “custody?” In addition, counties should be encouraged to adopt Maricopa County’s choice of the primary residential parent being the: “mother, father, or equal.” If the term, “primary residential parent” becomes a standard, the guidelines should be revised to include that term.
- *The section of the guidelines worksheet that indicates whether Parenting Time Table A or B is applied should be expanded to note whether Paragraph 12 is applied.* This may also help self-represented parents decide which parenting time adjustment to use. It will also be easier to identify which parenting time adjustment is being applied during the next case file review. Alternatively, some counties have developed another worksheet to apply Paragraph 12 in equal custody and unequal incomes. If an alternative worksheet is adopted, however, the Court should develop simplified instructions to direct the user to the appropriate worksheet.

Recommended Changes to the Parenting Time Adjustment. Generally, CPR recommends that the Committee review the intent of the three different ways to adjust for parenting time under the Guidelines, modify them as they deem appropriate, and provide better direction on which adjustment to use. This may help reduce the number of deviations among equal timesharing cases. One particular point of confusion is that Paragraph 12 is to apply to “essentially equal” parenting time, but Table A presumes that child-rearing costs are substantially or equally shared in each household when the obligor has at least 143 parenting days. This could be interpreted that either Table A or Paragraph 12 could be applied to cases with 143 parenting days. The increasing trend of essentially equal parenting cases heightens the need to clarify these adjustments.

Either make Parenting Time Table B easier to apply or eliminate it. Table B provides appropriate support awards when there is equal timesharing but not equal cost sharing; that is, one parent may incur more of the child’s clothing expenses than the other parent. Based on the case file review, it is never applied. Application of Table B requires proof that the parents are not engaged in equal cost sharing. Such proof may not be obtained easily. This may explain why Table B is not applied. On the other hand, the purpose of requiring proof may be to limit the application of Table B. The Committee or the Courts should review Table B to determine its purpose and whether it is fulfilling that purpose.

Recommended Threshold for Determining Reasonable Cost of Insurance. Arizona HB2505 passed by the 2008 Arizona Legislature defines the child's insurance to be reasonable cost if it does not, "exceed the higher of five percent of the gross income of the obligated parent or an income-based numeric standard that is prescribed in the child support guidelines." When considering any guidelines changes to address this statutory change, the Committee and Court may want to consider the findings from the case file review that suggests that a standard lower than five percent would likely result in private insurance being reasonable in cost in fewer cases.

Recommended Changes to Address Combined Incomes above \$20,000 per month. The Committee may want to consider extending the schedule to higher incomes, adopting a formula for incomes above the schedule, or eliminating the criterion that the obligee bears the burden of proof that a higher amount is appropriate. With regards to the latter option, most other states guidelines do not require the obligee to bear the burden of proof; rather, they allow for a higher amount under court discretion.

Consider the Consequence of Zero-dollar Orders. Zero-dollar orders comprise 14 percent of the 2007 sample, which is significantly more than the 2002 sample. About half of these orders involved guidelines amounts of \$100 or less before the deviation was made and many involved essentially equal parenting time. On the one hand, these zero order amounts may be appropriate. For example, zero orders are appropriate in equal parenting time and equal income cases. On the other hand, we do not know whether they are appropriately modified when the parenting time changes. A seminal study (MacCoby and Mnookin 1992) that tracked children of divorced parents over time finds that the child's residence changes over time and that as the child ages, the child is more likely to reside with one parent. Other concerns are that parents request order modifications infrequently (OCSE 2007) and that parents are often reluctant to request a modification because they fear rocking the boat with the other parent (Venohr and Price 1991). If these are valid concerns, perhaps more information about the modification process could be provided in mandatory parenting education. As is, parents with zero orders or essentially equal parenting time are more likely to attend parenting education than other case types.

CONCLUSION

Periodic guidelines reviews are an opportunity for states to review their guidelines and recommend changes to the guidelines that will make their application more just and appropriate while serving the best interest the child. The findings from an analysis of case file data, such as the findings summarized in this report, can inform the development of these recommendations.

APPENDIX E:

Proposed Arizona Child Support Guidelines

DRAFT ARIZONA CHILD SUPPORT GUIDELINES
PROPOSED EFFECTIVE DATE JANUARY 1, 2011

TABLE OF CONTENTS

Section I. General Information

- A. Purposes
- B. Premises
- C. Presumption
- D. Basis of Guidelines
- E. Definitions

Section II. Determining the Guideline Support Amount

- A. Income
- B. Inclusions to Gross Income of Parties
 - 1. Gross Income
 - 2. In-Kind or Other Non-Cash Benefits
 - 3. Self-Employment
 - 4. Expense Reimbursements
 - 5. Unemployed or Underemployed
- C. Exclusions from Gross Income
- D. Adjustments to Income
 - 1. Spousal Maintenance
 - 2. Support of Children
- E. Adjusted Gross Income
- F. Adjusting Support Amounts to Reflect the Parenting Time Allocation
 - 1. General Provisions
 - 2. Understanding the Parenting Time Adjustment
 - 3. Calculating Parenting Time
- G. Preliminary Support Amount
- H. When a Parent's Income is More Than \$20,000 Monthly
- I. More Than Four Children
- J. Adjustments to Support
 - 1. Childcare Costs
 - 2. Education Expenses
 - 3. Extraordinary Child
 - 4. Medical Support
 - 5. Applying Adjustments
- K. When the Custodial Parent Would Be the Guideline Support Obligor
- L. Self-Support Reserve
- M. Final Support Order
- N. Rounding the Final Support Order

Section III. Guideline Support Amount

- A. Court's Findings
- B. Exchange of Information
- C. Gifts in Lieu of Money
- D. Dependency Exemption
- E. Unreimbursed Medical Expenses
- F. Travel Expenses

Section IV. Special Circumstances

- A. Deviation
 - 1. By Court
 - 2. By Agreement
 - 3. Examples for Deviation
- B. Multiple Children, Divided Physical Custody
- C. Multiple Children, Varying Parenting Time Schedule
- D. Third Party Caregivers
- E. Support Assigned to State
- F. Income and Benefits
 - 1. Income of a Child
 - 2. Benefits Received on Behalf of a Child
 - 3. Benefits Not Included in Parent's Income
 - 4. Disabled Adult Child
- G. Arrears
 - 1. Setting an Amount for Payment on Arrears
 - 2. When the Current Child Support Obligation Terminates
 - 3. Modification of Payment on Arrears
 - 4. Court to Consider Obligor's Available Income

Section V. Modification and Termination of Support

- A. Duration and Termination of Child Support
- B. Effect of Emancipation
- C. Modification
 - 1. Standard Procedure
 - 2. Simplified Procedure
 - 3. By Agreement
- D. Phase-In Support Orders
 - 1. Purpose of This Section
 - 2. Actions to Which This Section Applies
 - 3. Determining Phase-In Eligibility
 - 4. Determining Whether a Phase-In Is Appropriate
 - 5. Implementing a Phase-In Support Order

Addendum A: User Guide for Determining Child Support

Addendum B: Parent's Child Support Worksheet

Addendum C: Correlation Table

I. General Information

A. PURPOSES

1. To establish a standard of support for children consistent with the reasonable needs of children and the ability of parents to pay.
2. To make child support orders consistent for persons in similar circumstances and set child support amounts based on the factors in A.R.S. § 25-320.
3. To give parents and courts guidance in establishing child support orders and to promote settlements.
4. To comply with state law (Arizona Revised Statutes (A.R.S. § 25-320) and federal law (42 United States Code, § 651 et seq., 45 Code of Federal Regulations, § 302.56) and amendments, if any.

B. PREMISES

1. These guidelines apply to all children, whether born in or out of wedlock, and their parents.
2. Support provided to other persons for whom the parent has no legal duty of support, such as the parent's stepchildren or parents, provides no basis for adjusting the amount of child support due under these guidelines.
3. Because child support has priority over other financial obligations, the existence of other obligations generally provides no reason for deviating from the guidelines. The guidelines themselves explain how to take account of other legal support obligations in calculating the support required for the children to whom they are being applied.
4. A parent who pays or receives child support may also be entitled to spousal maintenance. A court establishing both child support and spousal maintenance shall first determine the appropriate amount of spousal maintenance and then follow the provisions of these guidelines in taking spousal maintenance into account in setting the amount of child support.
5. Child support is set in equal monthly amounts. Therefore, monthly figures are used to calculate the child support obligation. Average monthly figures should be used when income or expense amounts fluctuate over the course of a year.
6. The child support calculation is based on Adjusted Gross Income, as defined in these Guidelines.

C. PRESUMPTION

These guidelines apply to all actions involving establishment of current or past child support or modification of child support. The court shall order the amount determined under these guidelines absent a deviation pursuant to Section IV(A).

D. BASIS OF GUIDELINES

The Arizona Child Support Guidelines are based on the financial resources and needs of the child and of each parent, the standard of living the child would have enjoyed in a two-parent household, and the allocation of parenting time, as contemplated by A.R.S. § 25-320(D). They reflect a systematic consideration of the impact of parental separation on the parents and their children to achieve outcomes that are fair to the child and both parents. For a detailed description of the methodology used to construct these Guidelines see the Child Support Guidelines Review Committee's Final Report and Recommendations located at: <http://www.supreme.state.az.us/csgrc/>

E. DEFINITIONS

These definitions are for the purpose of these guidelines only.

Adjusted Gross Income – Gross income adjusted as provided in Section II(D). This may differ from adjusted gross income for tax purposes.

Basic Support Amount – The amount found in the Basic Support Amount Tables for the parents' adjusted gross incomes and the number of children. The tables are provided in the Arizona Child Support Calculation Instructions Booklet. The calculator provides this amount automatically.

Calculator – The child support calculator located on the website of the Arizona Supreme Court website at: <http://www.supreme.state.az.us/csgrc/>

Children of Other Relationships – Children of either parent who are not the subject of this particular child support determination.

Child's Parents – Adults who have a legal obligation to support the child under Arizona law.

Custodial Parent – The parent with greater parenting time unless the parents share equal parenting time.

Equal Parenting Time – Parenting time is considered equal for purposes of these guidelines when each parent has at least 170 days per year of parenting time.

Final Support Order – The child support award entered by the court after applying the guidelines.

Gross Income – Income as defined in Section II(A), (B), and (C). This may differ from gross income for tax purposes.

Guideline Support Amount – The *preliminary* support amount adjusted for child care expenditures, health insurance premiums, educational costs, and expenses for extraordinary children, as described in Section II(J), as well as any adjustment required under Section II(K) when it may be inappropriate to order a custodial parent to pay child support.

Guideline Obligee – The parent who would receive the Guideline Support Amount.

Guideline Obligor – The parent who would pay the Guideline Support Amount.

Noncustodial Parent – The parent with less parenting time unless the parents share equal parenting time.

Parenting Time – The number of days per year that a parent has physical custody of the child, as calculated under Section II(F).

Parenting Time Adjustment – An adjustment to the Basic Support Amount to reflect parenting time as calculated under Section II(F).

Parent's Worksheet for Child Support Amount – (Also referred to as the “*worksheet*.”) The printable version of the entries and amounts from the calculator.

Phase-In Support Order - The monthly transitional child support award determined under Section V(D) of these guidelines.

Preliminary Obligee – The parent who would receive the Preliminary Support Amount. (This is an intermediate step to determining the Final Support Order.)

Preliminary Obligor – The parent who would pay the Preliminary Support Amount. (This is an intermediate step to determining the Final Support Order.)

Preliminary Support Amount – The Basic Support Amount adjusted for parenting time. (This is an intermediate step to determining the Final Support Order.)

Support Obligee – The parent ordered to receive support in the Final Support Order.

Support Obligor – The parent ordered to pay support in the Final Support Order.

II. Determining the Guideline Support Amount

A. INCOME

Basic Principles for Determining the Parental Income Considered in the Guidelines

1. The child support amount is based on the adjusted gross incomes of the child's parents, calculated according to the principles set forth in this section. The income of a parent's new spouse is not counted or included as income of the child's parent.
2. Each parent's gross income and adjusted gross income is determined as set forth in this section.

B. INCLUSIONS TO GROSS INCOME OF PARTIES

1. Gross income includes income from any source and may include, but is not limited to, income from salaries, wages, commissions, bonuses, dividends, severance pay, pensions, interest, trust income, annuities, capital gains, social security benefits (subject to Section IV(E)) received directly by either parent and not on behalf of a child, worker's compensation benefits, unemployment insurance benefits, disability insurance benefits, recurring gifts, and prizes. Seasonal or fluctuating income shall be averaged. Income from any source that is not continuing or recurring in nature need not be included as income for child support purposes.
2. Cash value may be assigned to in-kind or other non-cash benefits or to recurring contributions from any sources that reduce living expenses.
3. For income from self-employment, rent, royalties, proprietorship of a business, or joint ownership of a partnership or closely held corporation, gross income means gross receipts minus ordinary and reasonable expenses required to produce income. Ordinary and reasonable expenses include one-half of the self-employment tax actually paid.

4. Expense reimbursements or benefits received by a parent in the course of employment or self-employment or operation of a business shall be included in gross income if they are significant and reduce personal living expenses.
5. If a parent is unemployed or working below full earning capacity, the court may consider the reasons. If earnings are reduced as a matter of choice and not for reasonable cause, the court may attribute income to a parent up to his or her earning capacity. If the reduction in income is voluntary but reasonable, the court shall balance the benefits of that parent's decisions against the financial detriment, if any, to the child. If there is no available income information, the court shall presume that each parent is capable of earning at least the applicable minimum wage and attribute that amount to the parent. If income is attributed to the parent receiving child support, appropriate childcare expenses may also be attributed. However, the court may decline to attribute income to either parent. Examples of cases in which it may be inappropriate to attribute income include, but are not limited to, the following circumstances:
 - a. A parent is physically or mentally disabled,
 - b. A parent is engaged in reasonable career or occupational training to establish basic skills or reasonably calculated to enhance earning capacity,
 - c. Emotional or physical needs of a natural or adopted child require that parent's presence in the home, or
 - d. A parent is incarcerated.

C. EXCLUSIONS FROM GROSS INCOME

1. Gross income does not include sums received as child support or benefits received from means-tested public assistance programs including, but not limited to, Temporary Assistance to Needy Families (TANF), Supplemental Security Income (SSI), Food Stamps (now known as Nutrition Assistance), and General Assistance.
2. Gross income does not include benefits received on behalf of a child.
3. Each parent should have the choice of working additional hours through overtime or at a second job without affecting the child support award. Generally, the court should not include income greater than what would have been earned from full-time employment. The court may, however, include income actually earned that is greater than would have been earned by full-time employment if that income was historically earned from a regular schedule and is anticipated to continue into the future. The court should generally not include additional income if earning that

additional income would require an extraordinary work regimen. Determination of what constitutes an extraordinary work regimen depends upon all relevant circumstances, including the choice of jobs available within a particular occupation, working hours, and working conditions.

D. ADJUSTMENTS TO INCOME

1. The court-ordered amount of spousal maintenance resulting from this or any other marriage, if actually being paid, shall be deducted from the gross income of the parent paying spousal maintenance. The court-ordered amount of spousal maintenance resulting from this or any other marriage, if actually being paid, shall be added to the gross income of the parent receiving spousal maintenance. Court-ordered arrearage payments shall not be included as an adjustment to gross income.
2. Gross income is adjusted for support of children of other relationships as described below.
 - a. Court-ordered child support actually being paid shall be deducted from the gross income of the paying parent. Court-ordered arrearage payments shall not be included in the adjustment.
 - b. The following table applies to this sub-section:

TABLE ONE Adjustment for Support of Other Children							
ROWS	Number of Other Children	Total number of children the parent is legally obligated to support <i>(includes children being supported by court order)</i>					
		COLUMNS					
		2	3	4	5	6	7
	1	.125	.095	.080	.070	.055	.050
	2		.190	.155	.135	.115	.095
	3			.230	.205	.170	.145
	4				.270	.225	.195
	5					.280	.240
	6						.290

An amount may be deducted from the gross income of a parent for support of children of other relationships for whom that parent has a legal duty of support but for whom there has not been an adjustment under Section II(D)(2)(a) above. The amount to be deducted is determined using Table One above, as follows:

- (i) Select the column (“Total Number of Children the Parent is Legally Obligated to Support”) in Table One for the total number of children the parent seeking the adjustment is legally obligated to support, including the child or children who are the subject of this support calculation.

EXAMPLE:

If there are two children who are the subject of this support determination and two other children for whom the parent is legally obligated to support, use column 4.

- (ii) Select the row (“Number of Other Children”) for the number of children equal to:
- The total number of children for whom the parent has a legal duty to support:
 - Minus the children who are subject to this order, and
 - Minus other children for whom the parent is paying court-ordered child support.

EXAMPLE:

Father has four children, two of whom are the subject of this support determination, one for whom there is court-ordered child support being paid and one child living with Father. Use row 1, column 4. The adjustment is .080 (8%).

- (iii) Select the percentage that appears in the column and row determined above and multiply that figure by the parent’s gross income (after subtracting from that gross income any court-ordered child support for any other children actually being paid and any court-ordered spousal maintenance actually being paid). The resulting number is subtracted from the gross income. If there are more than seven total children for whom there is a legal duty to support or more than six “other” children, use the highest figure that applies for that row or column.

EXAMPLE:

Mother has four children – George, Mary, Jack and Jill. Jack and Jill are the children in this case. George and Mary are Mother’s children from a different relationship. George lives with his father and Mother pays \$250 per month child support for George. Mary lives with Mother. Mother’s gross income is \$5,000 per month. First, subtract \$250 in support Mother pays from her gross income. This reduces Mother’s gross income to \$4,750. Then, use Table One to calculate the “other child” adjustment for Mary to whom

Mother has a duty of support, but does not pay child support, because Mary lives with Mother. Use row 1, since Mary is the only “other child.” Mother has a total of four children, so use column 4. Using the table, the amount of the adjustment for Mary is .080 (8%). Multiply Mother’s remaining gross income of \$4,750 by .080. The result is \$380. Mother’s adjusted gross income is \$4,370 (\$5,000 minus \$250 child support for George minus \$380 for the “other child” adjustment for Mary.)

E. ADJUSTED GROSS INCOME

The amount determined after applying Sections II(A) through (D) constitutes the adjusted gross income under these guidelines.

F. ADJUSTING SUPPORT AMOUNTS TO REFLECT THE PARENTING TIME ALLOCATION

1. General Provisions

Parenting time is calculated, for the noncustodial parent, by the method described in subsection 3 below. All days not allocated to the noncustodial parent under this calculation are counted as parenting time for the custodial parent. The calculator will automatically compute the parenting time adjustment. To understand all the steps performed by the calculator, instructions for calculating the child support amount (Final Support Order) manually are provided in the Arizona Child Support Calculation Instructions Booklet.

2. Understanding the Parenting Time Adjustment

a. General Explanation

Arizona’s parenting time adjustment is designed to be fair to both parents. It takes into account both the *variable* and *duplicated* costs each parent incurs on account of the children, which depend in part on each parent’s share of the parenting time.

- i. Food is an example of a variable cost, because the amount a parent spends on the child’s food depends on how much time that parent has the child. The food costs will vary, in other words, with the parent’s share of the parenting time. Because every dollar one parent spends on variable costs reduces the other parent’s expenditures by roughly the same amount, it is appropriate to adjust the support payment by the full amount of the variable costs paid by

the noncustodial parent.

- ii. Duplicated costs are different because both parents incur the cost—what one parent spends does not reduce the amount the other parent must spend. An example is a bedroom for the child. A noncustodial father might incur the cost for a larger home with a spare bedroom used only by the child, but the noncustodial father's cost to provide the bedroom does not reduce the costs of the custodial mother who also provides a bedroom for the child. Duplicated costs are thus *extra* expenses for the child that result from the parenting time arrangement. These extra expenses, like other extra expenses considered in the guidelines, are divided between the parents in proportion to their income. For example, if Father earns 60% of the parents' income, and Mother earns 40%, then Arizona's parenting adjustment is designed so that Father pays 60% and Mother pays 40% of the duplicated costs.
- iii. The amounts for both the variable and duplicated costs were developed by studying available research and the methodology employed by other states using a similar approach.

b. EXAMPLE:

The following example sets out the basic idea. The example assumes that the mother has the child 75% of the parenting time, and the father has the child 25% of the parenting time.

First, the calculator looks up how much extra money the custodial household would need to have the same living standard as the noncustodial parent's household, assuming they were equal earners and the custodial parent had the child all the time. That allows for the calculation of how much extra the child can cost in total. For the purposes of this example, assume that this extra cost is \$200 per month. The calculator divides those costs in half, because on average, half the costs of children are variable and half the costs are duplicatable. In this example, there would be \$100 of variable costs and \$100 of duplicatable costs.

Because Father has the child 25% of the time, his variable costs are 25% of \$100, or \$25. The allocation of duplicatable costs is more complicated. While all the duplicatable costs are estimated at \$100 in this example, a parent who has the child 25% of the time will not normally incur *all* possible duplicatable costs. The calculator assumes that a father who has the child less than 15% of the parenting time will not incur any duplicatable costs, and that if he has the child for 45% of

the parenting time or more, he incurs all the duplicatable costs. The calculator also assumes that the amount Father spends on duplicatable costs increases proportionately as one goes from 15% to 45% of parenting time. In this example, where Father has the child for 25% of the time, he will incur one-third of the possible duplicatable costs (because 25% of all parenting days is one-third of the way from 15% to 45% of all parenting days). One-third of the \$100 of duplicatable costs is \$33, so this father's actual duplicated costs are estimated at \$33. If Mother earns 40% of the parents' income, then she is responsible for 40% of the father's duplicatable costs of \$33. Father's support obligation should be reduced by 40% of \$33, which is \$13.

Therefore, in this example, the total parenting time adjustment reduces Father's support payment by the \$25 he spends on variable costs, plus Mother's share of Father's duplicated costs, which is \$13. The calculator automatically reduces the support amount that Father would otherwise be asked to pay Mother by \$25 plus \$13, or \$38.

3. Calculating Parenting Time

Parenting time is measured in days per year. The number of parenting time days arising from the blocks of time the child spends with the noncustodial parent is calculated as follows:

- a. Each block of time begins and ends when the noncustodial parent receives or returns the child from the custodial parent or from a third party with whom the custodial parent left the child. Third parties include, for example, a school or a childcare provider. All time from beginning to end of each block of parenting time is included.
- b. Count one day of parenting time for each 24 hours within any block of time.
- c. To the extent there is a period of less than 24 hours remaining in the block of time, after all 24-hour days are counted or for any block of time that is in total less than 24 hours in duration:
 - (i) A period of 12 hours or more counts as one day.
 - (ii) A period of 6 to 11 hours counts as a half-day.
 - (iii) A period of 3 to 5 hours counts as a quarter day.
 - (iv) Periods of less than 3 hours may count as a quarter-day if, during those hours, the noncustodial parent pays for routine expenses of the child, such as meals.

- d. The blocks of time the child spends with the noncustodial parent are determined by the parenting time plan indicated in the court order or the historical practice of the parents.

EXAMPLE ONE:

Noncustodial parent receives the child at 9:00 p.m. on Thursday evening and brings the child to school at 8:00 a.m. on Monday morning, from which the custodial parent picks up the child at 3:00 p.m. on Monday.

- 9:00 p.m. Thursday to 9:00 p.m. Sunday is 3 days.
- 9:00 p.m. Sunday to 8:00 a.m. Monday is 11 hours, which equals a $\frac{1}{2}$ day.
- Total parenting time is $3\frac{1}{2}$ days per week or 182 days per year (equal parenting time). **Note:** If the start time on Thursday is 5:00 p.m. rather than 9:00 p.m., this would result in four days of parenting time per week under the calculations referenced above. However, since this schedule divides the week virtually equally between the parents, this is considered an equal parenting time schedule.

EXAMPLE TWO:

Noncustodial parent picks the child up from school at 3:00 p.m. Friday and returns the child to school at 8:00 a.m. on Monday.

- 3:00 p.m. Friday to 3:00 p.m. Sunday is 2 days.
- 3:00 p.m. Sunday to 8:00 a.m. Monday is 17 hours, which equals 1 day.
- Total parenting time is 3 days per week or 156 days per year.

EXAMPLE THREE:

Noncustodial parent picks up child from soccer at noon on Saturday and returns the child to custodial parent at 9:00 p.m. on Sunday.

- Noon Saturday to noon Sunday is 1 day.
- Noon Sunday to 9:00 p.m. Sunday is 9 hours, which equals $\frac{1}{2}$ day.
- Total parenting time is $1\frac{1}{2}$ days per week or 78 days per year.

G. PRELIMINARY SUPPORT AMOUNT

Determining the Preliminary Support Amount is an *intermediate* step in the child support calculation under these guidelines. The Preliminary Support Amount is most easily determined by the using the calculator provided on the court's website, using the parents' adjusted gross income, the number of children, and adjusting for parenting days. The

Preliminary Support Amount can also be calculated manually by consulting the Arizona Child Support Calculation Instructions Booklet, and following the instructions provided.

The parent who would pay the Preliminary Support Amount is the Preliminary Obligor. Usually this is the noncustodial parent. However, the custodial parent may be the Preliminary Obligor in the less common case in which the custodial parent's income is much larger than the noncustodial parent's income and the noncustodial parent has a substantial number of parenting days.

Determining the Preliminary Obligor and Preliminary Obligee are intermediate steps in the child support calculation under these guidelines. They do not alone provide the basis for a support order creating legal obligations.

H. WHEN A PARENT'S INCOME IS MORE THAN \$20,000 MONTHLY

The tables used for calculating the Preliminary Support Amount do not include adjusted gross income of either parent in excess of \$20,000 a month.

When using the Child Support Calculator: Enter each parent's actual adjusted gross income, as the calculator will automatically substitute an income of \$20,000 for the steps in which that is appropriate, while using the parents' actual adjusted gross income for the steps in which that is appropriate.

When calculating child support manually: Refer to the Arizona Child Support Calculation Instructions Booklet.

The court may deviate from the Guideline Support Amount in accordance with Section IV(A) when the monthly income of either parent exceeds \$20,000.

I. MORE THAN FOUR CHILDREN

The Preliminary Support Amount gives support amounts for up to four children. When five or more children are the subject of the support order, the support amount shall be calculated based upon four children, but the court may deviate from the Guideline Support Amount in accordance with Section IV(A).

J. ADJUSTMENTS TO SUPPORT

The following child-related expenses are generally shared by the parents in proportion to each parent's adjusted gross income. Each parent's proportionate share is determined by dividing that parent's adjusted gross income by the combined adjusted gross income of the parents.

1. CHILDCARE COSTS

The court may adjust the Preliminary Support Amount for childcare costs appropriate to the parents' financial abilities. Average monthly expenses for childcare should be calculated in accordance with Section I(B)(5).

2. EDUCATION EXPENSES

The court may adjust the Preliminary Support Amount for any necessary expenses appropriate to the parents' financial abilities for a child's attendance at a private or special school or necessary expenses to meet particular educational needs of a child when such expenses are incurred by agreement of both parents or ordered by the court.

3. EXTRAORDINARY CHILD

The court may adjust the Preliminary Support Amount appropriate to the parents' financial abilities to provide for the special needs of gifted or handicapped children. These guidelines are designed to fit the needs of most children; typical extracurricular and school activity expenses are not considered extraordinary expenses.

4. MEDICAL SUPPORT

State law requires orders for child support to assign responsibility for providing medical insurance for the children who are the subject of the child support order. (A.R.S. § 25-320, §25-500 and §25-529.) Cash medical support may be established if the court finds that neither parent can obtain medical insurance that is accessible and available at a reasonable cost.

The court shall adjust the Preliminary Support Amount to reflect the cost of the children's medical, dental, and vision insurance coverage, if any. (This provision does not imply any obligation of either parent to provide dental or vision insurance.) In determining the amount to be added, only the amount of the insurance cost attributable to the children who are the subject of the child support order shall be included. If coverage is applicable to other persons, the total cost shall be prorated by the number of persons covered. The court may decline to credit a parent for medical, dental, and vision insurance coverage obtained for the children if the coverage is not valid in the geographic region where the children reside. The court shall not adjust the Preliminary Support Amount for cash medical support pursuant to A.R.S. § 25-320(K) or (L).

EXAMPLE:

Through an employment-related insurance plan, Mother provides insurance that covers Mother, one child who is the subject of the child support case, and two other children. Under the plan, the cost of an employee's individual insurance coverage would be \$50. Mother instead pays a total of \$170 for the "family option." Subtract the \$50 cost of individual coverage from the \$170 for the "family option" to find the cost of dependent coverage, which is \$120. Divide the \$120 by 3, the number of dependents covered. The cost attributable to the child who is the subject of the case is \$40. The parents share the \$40 cost in proportion to each parent's adjusted gross income.

5. APPLYING ADJUSTMENTS

To adjust for court-approved costs of childcare, educational expenses, extraordinary expenses and health insurance add up the monthly amounts and then allocate the total cost between the parents in proportion to each parent's adjusted gross income. The Preliminary Obligor's share of these costs is added to the Preliminary Support Amount. Because payments the Preliminary Support Obligor makes to third parties for court-approved child-related expenses satisfy part of that parent's responsibility, these payments are subtracted from the Preliminary Support Amount. The result is the Guidelines Support Amount, unless further adjustments under Section II(K) apply. (Section II(K) applies only in those cases when, after adjustments in II(J), the custodial parent would be the Guideline Obligor.)

EXAMPLE:

Assume Father earns 60% and Mother earns 40% of their combined income. Father is the noncustodial parent and the Preliminary Obligor. The Preliminary Support Amount is calculated to be \$500 per month. In addition, the parents have other court-approved child-related expenses. Father pays \$100 per month for the child's health insurance premiums and Mother pays \$300 for childcare and the court has determined that the adjustments are to apply. The Preliminary Support Amount must be adjusted to reflect these additional expenditures. The calculations can be laid out in a table like the following:

	Paid by Father	Paid by Mother
Additional child-related costs:		
Childcare	0	\$300
Education	0	0
Extraordinary child expenses	0	0
Health insurance	<u>\$100</u>	<u>0</u>
Total paid by each parent	\$100	\$300
Total paid by both parents combined	\$400	
Preliminary Obligor's income share	60%	
Adjustment to Preliminary Support Amount	\$240	

This is the Preliminary Obligor's share of total additional child-related costs, computed as 60% of \$400 which is \$240.

The Preliminary Obligor's \$240 share of the additional child-related costs is added to the Preliminary Support Amount of \$500, bringing the Preliminary Support Amount to \$740 per month. This is Father's total responsibility under this example. He satisfies part of this responsibility by paying \$100 to the insurance company for the child's health insurance and is therefore entitled to have that amount subtracted from the \$740 figure. Subtracting \$100 from \$740 leaves \$640, the amount of the support payment that the father owes the custodial parent in addition to his direct payment of \$100 to the insurance company. This \$640 is the Guideline Support Amount (providing, as in this example, no further adjustments are required by Section II(K)). Since Father owes this payment, he is the Guideline Obligor. This calculation may be clearer in a table format like the following:

Preliminary Support Amount	\$500
+ Adjustment for Preliminary Obligor's share of additional costs	+\$240
= Total Adjusted Preliminary Support Amount	\$740
- Preliminary Obligor's Payment to Third Parties	-\$100
= <u>Guideline Support Amount</u>	<u>\$640</u>

Father owes the Guideline Support Amount of \$640.

K. WHEN THE CUSTODIAL PARENT WOULD BE THE GUIDELINE SUPPORT OBLIGOR

The above example illustrates the usual case in which the Guideline Support Amount is required to be paid by the noncustodial parent to the custodial parent. In some cases, after the Preliminary Support Amount has been calculated and then further adjusted as provided in Section II(J), the result may be that the custodial parent would be the Guideline Obligor and the noncustodial parent would be the Guideline Obligee. That is, the custodial parent would be required to pay child support to the noncustodial parent. In these cases, unless there is a basis for deviation in accordance with Section IV(A), the custodial parent shall pay the Guideline Support Amount to the noncustodial parent.

L. SELF SUPPORT RESERVE

The purpose of the Self Support Reserve is to protect the Guideline Obligor from a child support order that would reduce his or her available income below the 2009 federal poverty level of \$903 per month for a single person. The court shall therefore apply the Self Support Reserve test to the Guideline Support Amount by deducting \$903 from the Guideline Obligor's adjusted gross income. If the resulting amount is less than the Guideline Support Order, the court may reduce the Final Support Order to the resulting amount after first considering the financial impact the reduction would have on the custodial parent's household. This test applies to the current child support obligation only, but the court may also order a reduction in the payments the Guideline Obligor would otherwise be required to make on arrears.

EXAMPLE:

The Guideline Obligor's adjusted gross income is \$1,170 and the Guideline Support Amount is \$300. Subtracting \$903 from \$1,170 leaves a resulting amount of \$267, which is less than the \$300 Guideline Support Amount. The court may reduce the child support order to \$267. Before making any reduction, the court should consider the financial impact the reduction would have on the custodial parent's household. If both parents have insufficient income to be self supporting, the court has discretion to determine whether and in what amount the child support order should be reduced under this section.

M. FINAL SUPPORT ORDER

The Guideline Support Amount is subject to the Self Support Reserve test, provided for in Section II(L), or any finding that a deviation from the guidelines is appropriate under Section IV(A). The amount determined thereafter shall be the Final Support Order.

N. ROUNDING THE FINAL SUPPORT ORDER

1. When the Final Support Amount is insignificant, the court may round it to zero.
2. In all cases the court may round the Guideline Support Amount to the nearest ten dollars.
3. A rounded amount reached by the application of Paragraphs 1 and 2 is not a deviation.

III. Guideline Support Amount

A. COURT'S FINDINGS

The court shall make findings in the record as to: Gross Income, Adjusted Gross Income, Preliminary Support Amount, court-approved Adjustments to Support, Guideline Support Amount, and Final Support Obligation. The findings may be made by incorporating a worksheet containing this information into the file. The Final Support Order shall be a sum certain and shall start on a date certain. Absent good cause, the start date shall be the first day of a month. A new child support order shall be filed upon any change in the amount or due date of the child support obligation.

B. EXCHANGE OF INFORMATION

The court shall order that every 24 months, financial information such as tax returns, financial affidavits, and earning statements be exchanged between the parties. Unless the court has ordered otherwise, at the time the parties exchange financial information, they shall also exchange residential addresses and the names and addresses of their employers.

C. GIFTS IN LIEU OF MONEY

Once child support has been ordered by the court, the child support is to be paid in money. Gifts of clothing, etc., in lieu of money are not to be offset against the Final Support Order except by court order.

D. DEPENDENCY EXEMPTION

1. Whenever the current Final Support Order provides for a payment of at least \$1,200 per year, the federal tax exemptions applicable to the minor children shall be allocated between the parents as they agree, or, in the absence of their agreement, in a manner that allows each parent to claim allowable federal dependency exemptions proportionate to Adjusted Gross Income in a reasonable pattern that can be repeated in no more than 5 years. This may be done by allocating claiming of the children or claiming of specific years. To implement this provision, the proportionate share of the combined Adjusted Gross Income of both parents is rounded to the nearest fraction with a denominator no larger than 5 (i.e. 1/2, 1/3, 2/3, 1/4, 3/4 1/5, 2/5, 3/5, 4/5). For illustrative purposes, assume Father earns \$60,000 and Mother earns \$40,000 of the combined Adjusted Gross Income of \$100,000. Father's share of the combined income is 3/5. If Father

earned \$57,000 and Mother earned \$43,000, then $\frac{3}{5}$ would still be the fraction with a denominator of 5 or less that comes closest to Father's share of the parents' combined Adjusted Gross Income. The dependency exemption shall therefore be allocated utilizing this fraction. If a parent otherwise entitled to the dependency exemption would derive no tax benefit from claiming it in any given tax year, then the entire exemption for that tax year, and not just the share indicated by the preceding sentence, should be allocated to the parent who would derive a tax benefit for that tax year.

For the Support Obligor to utilize the allocated dependency exemption in the tax year at issue, the Support Obligor must be current on all child support and arrears payments ordered to be paid in that year. To be considered current, the child support and court-ordered arrearage payments due by December 31 of that tax year must be received by the Clearinghouse by January 15 of the next tax year. While enforceable as child support, any unpaid contributions to medical expenses or extracurricular expenses do not affect the entitlement to the dependency exemption unless reduced to a judgment and due by a date certain during that tax year.

If the Support Obligor is current as defined above, the other parent shall execute the necessary Internal Revenue Service (IRS) documents to allow the Support Obligor to claim the exemption. If the Support Obligor is not current as defined above, the other parent shall be entitled to the dependency exemption for that tax year.

EXAMPLE:

Father's percentage of adjusted gross income is approximately 67% and Mother's percentage is approximately 33%. All support payments are current. If there are three children, Father would be entitled to claim two children and Mother would be entitled to claim one child. If there is only one child, Father would be entitled to claim the child two out of every three years, and Mother would claim the child one out of every three years.

E. UNREIMBURSED MEDICAL EXPENSES

The court shall also specify the percentage that each parent shall pay, in excess of cash medical support, for any medical, dental, and/or vision costs of the children that are not covered by insurance. For purposes of this paragraph, non-covered "medical" means medically necessary medical, dental, and/or vision care as defined by Internal Revenue Service Publication 502.

Except for good cause shown, any request for payment or reimbursement of uninsured medical, dental, and/or vision costs must be provided to the other parent within 180 days after the date the services occur. The parent responsible for payment or reimbursement must pay his or her share, as ordered by the court, or make acceptable payment

arrangements with the provider or person entitled to reimbursement within 45 days after receipt of the request.

Both parents should use their best efforts to obtain services that are covered by applicable insurance. A parent who is entitled to receive reimbursement from the other parent for medical costs not covered by insurance shall, upon request of the other parent, provide receipts or other evidence of payments actually made.

F. TRAVEL EXPENSES

The court may divide parenting time travel expenses between the parents where one-way travel for parenting time exceeds 100 miles or in extraordinary circumstances. The court shall consider the financial resources of the parents and may consider how a parent's conduct, such as change of residence, has affected the costs. The court may:

1. Order one parent to reimburse the other parent. The party who is entitled to travel reimbursement shall provide written evidence to the other parent of expenses actually paid within 30 days of payment, and the other party shall reimburse the expense within 14 days of receipt of the written evidence, or
2. Assign to one parent all of the travel expenses and alter the child support to reflect the fact that the parent is paying all of the travel expenses.

IV. Special Circumstances

A. **DEVIATION**

1. **BY COURT**

The court may order support that is a deviation from the guidelines after considering all relevant factors, including those set forth in A.R.S. § 25-320, and applicable case law, if all of the following criteria are met:

- a. Application of the guidelines is inappropriate or unjust in the particular case;
- b. The court has considered the best interests of the children in determining the amount of a deviation. A deviation that reduces the amount of child support paid is not, by itself, contrary to the best interests of the children, and
- c. The court makes written findings in the child support order, minute entry or child support worksheet regarding (a.) and (b.) above, the Guideline Support Amount and the amount after the deviation.

2. **BY AGREEMENT**

The court may deviate from the guidelines based upon an agreement of the parties only if all of the following criteria are met:

- a. The agreement is in writing or stated on the record pursuant to Rule 69, Arizona Rules of Family Law Procedure (*ARFLP*).
- b. All parties have entered into the agreement with knowledge of the Guidelines Support Amount.
- c. All parties have entered into the agreement free of duress and coercion.
- d. The court complies with the requirements of Section IV(A)(1).

3. **EXAMPLES FOR DEVIATION**

Circumstances that may justify a deviation include, but are not limited to, the following:

- a. Excessive or abnormal expenditures, destruction, concealment or fraudulent disposition of community, joint tenancy and other property held in common, as provided in A.R.S. § 25-320(D)(7).
- b. Extraordinary income tax circumstances, such as either party receiving substantial tax-free income or significant pre-tax benefits.
- c. When there are more than four children for whom the child support is ordered.
- d. When the Support Obligor's monthly Adjusted Gross Income is greater than \$20,000 and the other parent's monthly Adjusted Gross Income is less than \$20,000, an upward deviation may be appropriate.
- e. When the Support Obligees' monthly Adjusted Gross Income is greater than \$20,000 and the other parent's monthly Adjusted Gross Income is less than \$20,000, a downward deviation may be appropriate.

B. MULTIPLE CHILDREN, DIVIDED PHYSICAL CUSTODY

When each parent is granted physical custody of at least one of the parties' children, each parent is obligated to contribute to the support of all the children. In that circumstance, separate child support calculations should be performed for the child or children in each parent's home. The amount of the resulting child support to be paid by the parent having the greater child support obligation shall be reduced by the amount of child support owed to that parent by the other parent.

EXAMPLE:

(For simplicity, this example does not consider parenting time.) Father's adjusted gross income is \$2,000 per month and he has primary care of one child. Mother's adjusted gross income is \$4,000 per month and she has primary care of two children. Prepare a worksheet to determine child support for the one child in Father's home. In a separate worksheet determine child support for the two children in Mother's home. Mother is obligated to pay \$787 for child support for the one child. This amount is reduced by the \$311 obligation owed by Father to mother for the two children. Thus, Mother shall pay \$476 per month to Father.

C. MULTIPLE CHILDREN, VARYING PARENTING TIME SCHEDULE

When there are multiple children whose parenting time schedules differ from one another, the parenting time adjustment cannot be determined with the same precision as when the children have the same schedule. In that circumstance, two separate calculations should be performed. The first should be based upon the assumption that all of the children are under the lesser parenting time schedule. The second calculation should be based upon the assumption that all of the children are under the greater parenting time schedule. The two resulting child support amounts shall represent the range of the support obligation between the two parenting time schedules. Based upon the particular circumstances of the case, the Final Support Order may be any amount that falls within the range of the two calculated figures.

EXAMPLE:

Father's gross income is \$4,000 and Mother's gross income is \$4,000. The parties have three children, all of whom reside primarily with Mother. One of the children has 50 days of parenting time with Father and the other two children have 150 days of parenting time with Father. Calculate the child support obligation for all three children assuming that they are each under the 50 day parenting time schedule. This results in a monthly obligation owed by Father of \$796. Then calculate the child support obligation for all three children under the 150-day parenting time schedule. This results in a monthly obligation owed by Father of \$479. The two resulting figures of \$796 and \$479 provide the range for the Final Support Order. Any amount within this range is considered consistent with the guidelines and it is not a deviation.

D. THIRD-PARTY CAREGIVERS

When a child lives with a third-party caregiver by virtue of a court order, administrative placement by a state agency, or under color of authority, the third-party caregiver may be entitled to receive child support payments from each parent on behalf of the child.

E. SUPPORT ASSIGNED TO THE STATE

If child support or cash medical support has been assigned to the state under A.R.S. § 46-407 or A.R.S. § 25-320(K)(1), or any subsequently-adopted authorities, the obligation of a parent to pay child support or cash medical support shall not be offset by child support arrearages that may be owed to that parent. Child support or cash medical support assigned to the state may not be waived or forgiven by the custodial parent.

F. INCOME AND BENEFITS

1. INCOME OF A CHILD

Income earned or money received by a child from any source other than court-ordered child support shall not be counted toward either parent's child support obligation except as described below.

2. BENEFITS RECEIVED ON BEHALF OF A CHILD

Benefits, such as Social Security Disability (SSDI) or other insurance received by a custodial parent on behalf of a child as a result of contributions made by the Support Obligor shall be credited as follows:

- a. If the amount of the child's benefit for a given month is equal to or greater than the Support Obligor's child support obligation, then the Support Obligor's obligation is satisfied.
- b. Any benefit received by the child for a given month in excess of the child support obligation shall not be credited against arrears, credited toward future support payments, or subject to any claim for reimbursement.
- c. If the amount of the child's benefit for a given month is less than the Support Obligor child support obligation, the Support Obligor shall pay the difference between the benefit and the child support obligation.

3. BENEFITS NOT INCLUDED IN PARENT'S INCOME

Benefits received by either parent on behalf of a child are not included as gross income pursuant to Section II(C)(2).

4. DISABLED ADULT CHILD

Pursuant to A.R.S. § 25-320(E) and A.R.S. § 25-809(F), the court may order support to continue past the age of majority for a disabled child if the child is severely mentally or physically disabled as demonstrated by the fact that the child is unable to live independently and be self-supporting. In such a case, the court may take into account income earned or money received by or on behalf of the disabled adult child against any child support obligation. **Note:** Depending upon the nature of the court order, the benefits received by the disabled adult child may be reduced.

G. ARREARS

1. When setting or modifying the amount of an arrearage payment, the court shall balance all relevant considerations including the total amount of arrears, the accruing interest, the time it will take the obligor to pay these amounts, the obligee's financial circumstances, support of other children, and the obligor's reasonable ability to pay. The court shall not set the payment on arrears at an amount less than the accruing monthly interest unless there are compelling circumstances justifying a lower payment and the court makes a finding explaining why the lower payment is justified.
2. When a current child support obligation terminates, the court shall consider the amount of the monthly child support obligation at the time of termination as evidence of the amount the obligor has the ability to pay monthly towards arrears.
3. The court may modify the amount of the payment on arrears upon a showing of substantial and continuing changed circumstances.
4. In setting or modifying the arrearage payment the court shall consider whether the obligor's available income after payment of all current child support obligations and payments on arrears meets the Self Support Reserve test. (\$903 monthly income.)

V. Modification and Termination Of Support

A. DURATION AND TERMINATION OF CHILD SUPPORT

Duration of child support is governed by A.R.S. § 25-320 and A.R.S. § 25-501. Child support shall continue until a child reaches the age of majority unless that child is attending high school or a certified high school equivalency program at the time that the child turns 18. In that case, child support shall continue so long as the child is actually attending high school or the equivalency program, but only until the child reaches 19 years of age. In some circumstances, child support may continue after a child's 19th birthday but only if the child is severely mentally or physically disabled as demonstrated by the fact that the child is unable to live independently and be self-supporting.

The child support obligation presumptively terminates on the last day of the month of the 18th birthday of the youngest child included in the order unless the youngest child will not complete high school by age 18. In that event, the presumptive termination date shall be the last day of the month in which the child graduates from high school, stops attending high school, or turns age 19, whichever occurs first. In non Title IV-D cases the presumptive termination date should be included in an order of assignment. **HOWEVER, THE ORDER OF ASSIGNMENT OR INCOME WITHHOLDING ORDER MAY NOT STOP AUTOMATICALLY. IN THAT EVENT, A MOTION TO STOP THE INCOME WITHHOLDING ORDER MAY BE NECESSARY. IN A TITLE IV-D CASE THE PERSON PAYING SUPPORT MAY CONTACT THE DEPARTMENT OF ECONOMIC SECURITY WHICH CAN ADMINISTRATIVELY STOP THE INCOME WITHHOLDING ORDER.**

An employer or other payor of funds honoring an order of assignment or an administrative income withholding order that includes the presumptive termination date and is for current child support only may discontinue withholding monies after the last pay period of the month of the presumptive termination date. If the order of assignment or administrative income withholding order includes current child support and arrearage payment, notwithstanding the presumptive termination date, the employer or other payor of funds shall continue withholding the entire amount listed on the order of assignment or administrative income withholding order until further order. For purposes of determining the presumptive termination date, it is further presumed:

1. That a child not yet in school will enter 1st grade if the child reaches age 6 on or before September 1 of the year in which the child reaches age 6; otherwise, it is presumed that the child will enter 1st grade the following year, and,

2. That a child will graduate in the month of May after completing the 12th grade.

Even if a child support obligation has stopped, any order of assignment may not terminate. If the order of assignment does not stop, a specific order stopping the wage assignment must be obtained. In a Title IV-D case, the wage assignment may be stopped by contacting the IV-D agency.

B. EFFECT OF EMANCIPATION

If child support is ordered for more than one child, the amount of child support does not automatically change if one of the children graduates from high school, reaches the age of majority, dies, or is otherwise emancipated. To obtain a modification of the child support order, a request, petition or agreement must be made in writing to the court to recalculate the child support obligation pursuant to these guidelines.

C. MODIFICATION

Child support orders can be modified only by court order. An order to modify child support can be obtained through any of the following procedures:

1. STANDARD PROCEDURE

Pursuant to A.R.S. § 25-327 and § 25- 503, either parent or the state Title IV-D agency may ask the court to modify a child support order upon a showing of a substantial and continuing change of circumstances.

2. SIMPLIFIED PROCEDURE

Either parent or the state Title IV-D agency may request the court to modify a child support order if application of the guidelines results in a Final Support Order that varies 15% or more from the existing Final Support Order. A 15% variation in the amount of the Final Support Order will be considered evidence of a substantial and continuing change of circumstances. The simplified procedure also may be used by either parent or the state to establish a cash medical support order or to modify a child support order to assign or alter the responsibility to provide medical insurance for a child who is subject of a child support order. A modification of the medical assignment or responsibility does not need to vary by 15% or more from the existing Final Support Order to use the simplified procedure. A request for modification of the child support amount must be accompanied by the following documents: a completed and sworn Parent's Worksheet For Child Support Amount, and "Affidavit of Financial Information" (see Section XIV Rule 97, *ARFLP, Form 2*) documentation supporting the incomes if different from the court's most recent findings regarding income of the parents (including, without limit, copies of the last three years' tax returns filed by or on behalf of the

applicant and/or any entity in which the applicant has an interest and the last six payroll stubs for the applicant); the last child support order entered by the court; evidence of whether the applicant, if the child support obligor, has paid child support for the past 12 months; and evidence of every category of adjustment within the child support worksheet (i.e., insurance expense, education expense, etc.). If the applicant is unable to provide documentation regarding the other parent's income or expenses, the requesting party shall indicate that the income amount for that parent is attributed and/or estimated and shall set forth the basis relied upon to include that income or expense figure. The state Title IV-D agency may submit a worksheet.

The simplified procedure shall not be applicable to any self-employed parties where self-employment is a significant source of income absent the agreement of both parents. If a self-employed parent files a simplified modification action, the other parent shall either file a request for hearing, or an objection to simplified process within the same time allowed to that parent to request a hearing. If the objection is timely filed, the modification matter shall be heard under the standard procedure.

If a responding party objects in writing to the simplified procedure within 20 days after service (if served in state), or 30 days after service (if served out of state), the matter shall be conducted under the standard procedure.

A copy of the request for modification of child support and the Parent's Worksheet for Child Support Amount, including supporting documentation, showing that the proposed child support amount would vary 15% or more from the existing child support order shall be served on the other parent, or on both parents if filed by the state Title IV-D agency, pursuant to Rule 27, *ARFLP*.

If the requested modification is disputed, the parent disputing the modification must request a hearing within 20 days after service. If service is made outside the state, as provided in Rule 42, *ARFLP*, the parent receiving service must request a hearing within 30 days after service.

A party requesting a hearing or objection to simplified process shall file a written request for hearing or objection and, if the party is requesting a hearing, the hearing request must be accompanied by a completed and sworn Parent's Worksheet for Child Support Amount. Copies of the documents filed, together with the notice of hearing objection, shall be served on the other party and, if appropriate, the state Title IV-D agency by first class mail not less than ten judicial days prior to the hearing.

Upon proof of service and if no hearing is requested within the time allowed, the court will review the request and enter an appropriate order or set the matter for hearing.

If any party requests a hearing within the time allowed, the court shall conduct such hearing. No order shall be modified without a hearing if one is timely requested.

The notice provision of Rule 44, *ARFLP*, does not apply to this simplified modification procedure.

A request to modify child support, request for a hearing and notice of hearing, Parent's Worksheet for Child Support Amount and child support order filed or served pursuant to this subsection must be made using forms approved by the Arizona Supreme Court or substantially similar forms.

Approved forms are available from the clerk of the superior court.

3. BY AGREEMENT

The parties may agree to modify a Final Support Order. To become effective, the agreement must be in writing, signed by all parties, filed with the clerk of court, and approved by the court. If the agreed-upon amount is different from the amount calculated under the guidelines, it must be explained as required by Section IV(A) above.

D. PHASE-IN SUPPORT ORDERS

1. Purpose of This Section

Because these guidelines change the manner in which child support is determined, a significant increase in the child support award set under prior guidelines may occur in certain circumstances. This may create a financial hardship, which may be a basis to phase in the increased support amount by setting a Phase-In Support Order for a specified period before the Final Support Order becomes effective.

2. Actions to Which This Section Applies

The phase-in rule set forth in this section applies only to actions:

- a. Filed on or before August 31, 2013, and
- b. That seek to modify a child support order made under any guidelines in effect prior to these guidelines. This section does not apply to actions to modify support awards made under these guidelines.

3. **Determining Phase-In Eligibility**

If the Final Support Obligor invokes this section in a modification action to which it applies, the court shall first determine the Final Support Order under these guidelines without considering this section. It shall then determine whether this Final Support Order is eligible to be phased in, using the following procedure:

- a. Determine what the equivalent order would have been under the guidelines in effect immediately before adoption of these guidelines, assuming the same facts that were used to calculate the Final Support Order under these guidelines.
- b. Divide the Final Support Order under these guidelines (numerator) by the equivalent order that would have been set under the immediately preceding guidelines (denominator). The resulting quotient should then be converted to a percentage.
- c. If the resulting percentage so calculated is 150% or greater, then the Final Support Order calculated under these guidelines is eligible to be phased in.
- d. **EXAMPLE:** The Final Support Order under these guidelines is \$1,000. The equivalent order under the immediately preceding guidelines would have been \$800. The result of dividing \$1,000 by \$800 is 1.25 (125%). Since the difference is less than 150%, this order is not eligible to be phased in under this section, and the following steps shall not apply.

4. **Determining Whether a Phase-In is Appropriate**

Assuming the percentage determined by application of the above formula is 150% or greater, the court shall proceed as follows to determine whether a phase-in of the Final Support Order is appropriate:

- a. The court shall first consider whether the obligation to pay the additional amount required by a Final Support Order calculated under these guidelines, as compared to the equivalent order calculated under the preceding guidelines, imposes an unreasonable economic hardship on the Final Support Obligor. An economic hardship may be unreasonable if it arises from the Support Obligor's reliance on the prior guidelines and it interferes significantly with meeting established budgets and financial commitments for living and other expenses. The Support Obligor has the burden of proving the facts needed to establish that he or she will suffer an unreasonable economic hardship under this section.
- b. If the court finds that the Support Obligor has not met the burden of proof, then the Final Support Order shall not be phased in under this Section.
- c. If the court does find that the Support Obligor will suffer an unreasonable economic hardship, then it shall balance this concern against the impact of the delay in implementing the full amount of the Final Support Order on

the economic well-being of the child, to determine whether a phase-in of the Final Support Order is appropriate.

5. Implementing a Phase-In Support Order

- a. If the court determines that a phase-in is appropriate under Paragraph 4 of this section, it may reduce the amount of the Final Support Order by not more than 50% of the difference between the Final Support Order, and the equivalent amount that would have been ordered under the immediately preceding guidelines. This reduced amount is the Phase-In Support Order.
- b. The Phase-In Support Order made pursuant to the preceding paragraph shall remain in effect for a period that the court believes fair and reasonable under the circumstances, but not to exceed 18 months from the effective date of the Phase-In Support Order. The Phase-In Support Order shall specify a date certain on which it will be replaced by the Final Support Order. During the term of the Phase-In Support Order, no arrears or reimbursement claim shall accrue with respect to the difference between the Phase-In Support Order and the amount that otherwise would have been ordered under these guidelines if not for the phasing-in of the award.

EXAMPLE:

The current child support order entered before these guidelines went into effect requires Father (Support Obligor) to pay to Mother (Support Oblige) \$500 per month. Mother seeks an upward modification of child support. Under these guidelines, the Final Support Order would be \$1,000 per month, and the effective date for the increase would be January 1, 2011. A second worksheet is completed to determine the equivalent support award under the guidelines in effect immediately before adoption of these guidelines. That amount is determined to be \$600 per month. The current calculated amount (\$1,000) is divided by the amount calculated under the prior guidelines (\$600), resulting in a percentage of 167%. The court finds that the full increase would be an unreasonable hardship to Father, given financial commitments that he made in advance of the modification proceeding that he cannot adjust for without additional time. The court further finds that the hardship to Father outweighs the potential financial detriment of delay to the child. The increase in the support award is therefore phased-in, commencing January 1, 2011 and continuing through June 30, 2012 (18 months), and the Phase-In Support Order is set at \$800 per month (\$1,000 minus 50% of the difference between \$600 and \$1,000). The order would further provide that the Final Support Order of \$1,000 per month would become effective automatically as of July 1, 2012.

ADDENDUM A

USER GUIDE FOR DETERMINING SUPPORT

There are a specific number of steps to the process of determining child support under these guidelines. A child support worksheet can be completed by following this step-by-step process and considering the related guideline sections.

Step 1: Number of Children - Enter the names and dates of birth for each child who is the subject of this court order. If there are more than four children, see Section II(I).

Step 2: Determining Parents Income - Determine the gross income of each parent (as defined by these guidelines). See Sections II(A), (B), (C) and (H) for what is included and excluded in gross income.

Step 3: Adjustments to Parent's Income - The gross income of each parent may be adjusted up or down based on paying or receiving spousal maintenance, paying child support for other children, or directly supporting other children. See Sections II(D) and (E).

Step 4: Parenting Time Adjustment - The child support amount may be adjusted to take into account the financial effects of parenting time. If it applies, this adjustment is made before determining the Preliminary Support Amount. See Section II(F) and, in special circumstances, Section IV(B) and (C).

Step 5: Preliminary Support Amount - The initial support figure shall be provided automatically through the COBS Calculator or may be manually determined. See Section II(G).

Step 6: Adjustments to Support - After determining the Preliminary Support Amount, adjustments for expenses such as medical insurance coverage, childcare costs, education expenses and those costs that relate to the needs of a specific child may be made. See Section II(J).

Step 7: Guideline Amount - This is the figure derived from performing the steps noted above. See Section II(J)(5) and (K).

Step 8: Support to be Ordered - The amount to be ordered may be the Guideline Amount or may be higher or lower if the paying parent's income is low and the Self-Support Reserve applies or if a deviation is appropriate based upon the circumstances of a specific case. See Section II(L) for the Self-Support Reserve test (which is designed to balance the basic needs for all parties). See Section IV(A) to see whether a deviation may be appropriate and Sections V(B) and (C) for circumstances in which there is divided physical custody or varying parenting time schedules among the children. See also Section III, which relates to the Final Support Order.

This guide is not intended to address every situation that may arise but should assist in the vast majority of cases.

APPENDIX H:

Table 2 Child Support Ranking Chart

CHILD SUPPORT RANKING CHART

1 Child, 100 Days Parenting Time

Comparison of support amounts in current AZ guidelines, Marginal Expenditure Guidelines (MEG), COBS, and selected other states.

1= First highest amount 2= Second highest amount 3= Third highest amount 4= Fourth highest amount 5= Lowest amount

		Child Support Guidelines					Compared with Other States			
Line Number	CP Income	NCP Income	Current AZ guidelines (2005)	MEG (2007)	COBS (2009)	Ranking among states (COBS)	New MA (Top-range of CSO's)	IA (Mid-range CSO's)	WI (Bottom-range of CSO's)	OR w/AZ parenting time adj. (Similar to AZ)
1	0	\$1,000	\$194	\$97	\$97	4	\$238	\$223	\$185	\$42
2	0	\$2,000	\$352	\$351	\$435	3	\$494	\$442	\$370	\$328

[Proposed Arizona Child Support Guidelines](#)
[June 17, 2009 Arizona Judicial Council Meeting Materials](#)

Pursuant to the Arizona Revised Statutes § 25-320(D), the Supreme Court shall establish guidelines for determining the amount of child support and review the guidelines at least once every four years to ensure that their application results in the determination of appropriate child support amounts.

If you have a comment or suggestion you would like the Child Support Guidelines Review Committee to consider, you may [submit a comment](#). Please submit your comments to the Committee by August 31, 2008 to ensure sufficient time for review and consideration. Due to Committee deadlines, comments received after this date may be considered only if time permits.

COBS Calculator (Excel Spreadsheet)- **PLEASE NOTE:** If you receive an error message, add the "Analysis Toolpack" to your Excel program. To add this toolpack within Excel, click on "Tools" then choose "Add Ins", then choose "Analysis Toolpack." The program may require re-opening after adding in the toolpack. Save changes.
